

Finding Identification Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: ADIT® — Continuous Audit & Evidence Governance Architecture

Parent Standard: Audit Findings Standard

Operational Layer: Audit Findings Governance Layer

Category: Governance & Enforcement

Subcategory: Audit & Evidence Governance

Type: Parent Standard Module

Governed Space: Finding Identification

Version: 1.0

Status: Canonical · Open Module

Origin Date: 26 July 2026

Compatibility: OOF Methodology OS · GOA™ · OBIDENTITY® · INTEGROS® · ORA™ · AGA™ · AIG® · CLIA® · MGIA™ · ASGA™ · RIS™

AI-Readable: Yes

Authority: OOF®

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Governed Space

Finding Identification

Canonical Definition

Finding Identification Module defines the governance framework for identifying potential audit findings from verified evidence produced through governed audit execution. It establishes identification principles, evaluation criteria, governance controls, identification methodology, and continuous identification assurance necessary to ensure that every audit finding is objectively recognized, evidence-based, and methodologically justified.

Operational Role

Finding Identification Module governs the identification layer of audit findings by ensuring that potential findings are recognized objectively and consistently before they are classified, validated, documented, and formally issued.

Minimum Implementation Framework

1. Define Identification Requirements

Identify finding criteria, governance objectives, identification thresholds, evaluation requirements, responsible authorities, and operational conditions for recognizing potential findings.

2. Define Identification Methodology

Establish standardized procedures for reviewing verified evidence, identifying audit findings, documenting observations, and ensuring methodological consistency.

3. Define Identification Validation Logic

Define how potential findings are evaluated by verifying supporting evidence, governance conformity, operational significance, repeatability, and objective justification.

4. Define Governance Response

Establish governance actions for disputed findings, unsupported observations, identification errors, validation failures, conflicting interpretations, and corrective measures.

5. Preserve Identification Records

Maintain finding identification history, supporting evidence, governance decisions, validation records, timestamps, and corrective actions throughout the complete audit lifecycle.

Example Use Cases

Use Case 1 — Autonomous AI Governance

Scenario

An organization audits an autonomous AI platform and evaluates verified evidence generated during system operation.

Application

Finding Identification Module governs the systematic identification of operational issues, governance deviations, and significant observations supported by verified evidence.

Result

Potential audit findings are identified consistently, objectively, and with complete evidential support before further evaluation.

Use Case 2 — Regulatory Compliance Audit

Scenario

A regulatory authority reviews verified audit evidence collected during a

compliance inspection.

Application

Finding Identification Module governs the identification of regulatory findings using standardized governance criteria and documented evidence evaluation.

Result

Every potential finding is objectively recognized, evidence-based, and suitable for formal audit assessment.

Canonical Closing Statement

Finding Identification Module establishes the canonical governance framework for objectively identifying audit findings from verified evidence. By governing finding identification, evidence evaluation, governance controls, validation, and continuous identification assurance, the module enables reliable audit conclusions, operational reconstruction, accountable governance, and independent verification across all operational domains.
