

Response Verification Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: ADIT® — Continuous Audit & Evidence Governance Architecture

Parent Standard: Audit Response Standard

Operational Layer: Audit Response Governance Layer

Category: Governance & Enforcement

Subcategory: Audit & Evidence Governance

Type: Parent Standard Module

Governed Space: Response Verification

Version: 1.0

Status: Canonical · Open Module

Origin Date: 30 July 2026

Compatibility: OOF Methodology OS · GOA™ · OBIDENTITY® · INTEGROS® · ORA™ · AGA™ · AIG® · CLIA® · MGIA™ · ASGA™ · RIS™

AI-Readable: Yes

Authority: OOF®

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Governed Space

Response Verification

Canonical Definition

Response Verification Module defines the governance framework for verifying that approved audit responses have been fully implemented and have effectively resolved the validated audit findings. It establishes verification methodology, evidence requirements, governance controls, acceptance criteria, and continuous verification assurance necessary to ensure that every completed response is objectively confirmed, measurable, and independently verifiable.

Operational Role

Response Verification Module governs the verification layer of audit response by ensuring that implemented corrective actions are objectively evaluated and confirmed before they are considered completed and formally closed.

Minimum Implementation Framework

1. Define Verification Requirements

Establish verification objectives, acceptance criteria, evidence requirements, responsible authorities, governance thresholds, and completion conditions.

2. Define Verification Methodology

Develop standardized procedures for reviewing completed corrective actions, validating implementation evidence, confirming achieved outcomes, and documenting verification decisions.

3. Define Verification Validation Logic

Verify that corrective actions have been fully implemented, satisfy governance requirements, resolve the original audit findings, and are supported by objective evidence.

4. Define Governance Response

Establish procedures for failed verification, incomplete implementation, unresolved findings, governance exceptions, rework requirements, and escalation mechanisms.

5. Preserve Verification Records

Maintain complete verification history, supporting evidence, reviewer decisions, approvals, timestamps, governance actions, closure records, and audit trails throughout the response lifecycle.

Example Use Cases

Use Case 1 — Autonomous AI Governance

Scenario

An organization completes corrective actions following an audit of an autonomous AI system.

Application

Response Verification Module governs the independent verification that every approved corrective action has been successfully implemented and that the identified governance deficiencies have been resolved.

Result

Only objectively verified and evidence-supported responses are accepted as complete, ensuring accountable governance and operational improvement.

Use Case 2 — Regulatory Compliance Audit

Scenario

A regulatory authority reviews whether a regulated organization has successfully completed all required corrective actions.

Application

Response Verification Module governs the verification of implementation evidence, assessment of achieved outcomes, and formal confirmation that regulatory findings have been resolved.

Result

Corrective actions are formally verified, transparently documented, and independently defensible before the audit response is officially closed.

Canonical Closing Statement

Response Verification Module establishes the canonical governance framework for verifying completed audit responses. By governing verification methodology, evidence evaluation, governance controls, acceptance criteria, and continuous verification assurance, the module enables accountable audit closure, operational improvement, transparent governance, and independent verification across all operational domains.
