

Behavioral Audit Readiness Module - (BARM)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-AIG-BAS-BARM-2026-06-26-0005

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: AI Governance Architecture (AIG®)

Operational Layer: AI Behavioral Governance Layer

Governed Space: Behavioral Audit Readiness

Category: AI Governance

Subcategory: AI Behavioral Governance

Type: Behavioral Auditability Standard Module

Parent Standard: Behavioral Auditability Standard (BAS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 26 June 2026

Compatibility: OOF Methodology OS · AI Governance Architecture (AIG®) · Governance Architecture (GOA™) · Operational Reality Architecture (ORA™) · Cognitive Governance Intelligence Architecture (CLIA®) · Memory Governance Intelligence Architecture (MGIA™) · Accountability Governance Architecture (AGA™) · Autonomous Systems Governance Architecture (ASGA™)

AI-Readable: Yes

Authority: OOF

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Behavioral Audit Readiness Module (BARM) defines the structural conditions under which AI systems remain continuously prepared for independent governance audits by preserving complete behavioral records, governance evidence, verification results, attribution information, explainability artifacts, and audit documentation throughout the complete behavioral lifecycle.

BARM governs behavioral audit readiness.

The module establishes the foundational conditions required to ensure that AI systems are continuously audit-ready rather than being prepared only after an incident, investigation, regulatory request, or compliance review.

Auditability is not an event.

Auditability is a permanent governance state.

BARM governs that readiness.

Module Operational Role

BARM defines the behavioral-audit-readiness layer of BAS.

Its role is to ensure that AI behavioral governance remains continuously prepared for independent audit, regulatory review, compliance verification, and governance assessment.

Module Operational Space

BARM governs:

- behavioral audit readiness
- governance audit preparation
- audit documentation
- audit evidence management
- compliance readiness
- governance readiness
- continuous audit preparedness
- audit lifecycle governance

The module applies wherever AI systems must demonstrate continuous readiness for internal or external governance audits.

Module Function

The module applies wherever systems must preserve:

- continuous audit readiness
- complete governance documentation
- available behavioral evidence
- verified behavioral history
- explainable behavioral decisions
- independently auditable governance records

Its function is to ensure that AI behavioral governance can be independently audited at any time without requiring post-event reconstruction or additional preparation.

Minimum Implementation Framework

1. Define the Audit Readiness Object

The organization must define which AI systems, behaviors, and governance activities require continuous audit readiness.

2. Define Audit Readiness Conditions

The system must preserve:

- behavioral records
- verification records
- attribution records
- explainability records
- governance evidence
- audit documentation

3. Define Audit Readiness Degradation Detection Logic

The system must identify conditions including:

- incomplete audit records
- missing governance evidence
- unavailable behavioral history
- incomplete documentation
- expired audit artifacts
- governance-invalid audit readiness

4. Define Operational Response or Governance Logic

Governance response may include:

- audit readiness review
- documentation recovery
- governance validation
- compliance reassessment
- audit preparation improvement
- operational correction

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- audit records
- governance reviews
- behavioral evidence
- verification history
- audit preparation activities
- resulting behavioral states

An AI behavioral environment must not remain auditability-valid if materially significant audit-readiness activities cannot be reconstructed, reviewed, validated, preserved, or governed.

Use Case 1 — Financial Services AI

Scenario

A financial regulator requests an immediate audit of an AI system responsible for automated investment recommendations.

Application

BARM ensures that governance documentation, behavioral history, verification records, attribution information, and supporting evidence are immediately available for independent regulatory review.

Result

The organization demonstrates regulatory compliance, reduces audit preparation time, strengthens governance credibility, and increases institutional trust.

Use Case 2 — Healthcare AI Platform

Scenario

A hospital performs an external governance audit of its AI-assisted diagnostic platform.

Application

BARM ensures continuous availability of behavioral records, governance evidence, explainability artifacts, verification history, and audit documentation.

Result

The healthcare organization improves governance transparency, strengthens regulatory readiness, supports patient safety, and demonstrates trustworthy AI governance.

Canonical Closing Statement

Behavioral Audit Readiness Module (BARM) defines the structural conditions under which AI systems remain continuously prepared for independent governance audits by preserving complete behavioral records, governance evidence, verification results, attribution information, explainability artifacts, and audit documentation throughout the complete behavioral lifecycle.

Behavior that can be reconstructed, verified, attributed, and explained must also remain continuously ready for independent audit. Behavioral Audit Readiness therefore completes the Behavioral Auditability Standard within AI Governance Architecture (AIG®).
