

Behavioral Correction Identification Module - (BCIM)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-AIG-BCS-BCIM-2026-06-26-0001

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: AI Governance Architecture (AIG®)

Operational Layer: AI Behavioral Governance Layer

Governed Space: Behavioral Correction Identification

Category: Governance & Enforcement

Subcategory: AI Behavioral Correction Governance

Type: Behavioral Correction Standard Module

Parent Standard: Behavioral Correction Standard (BCS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 26 June 2026

Compatibility: OOF Methodology OS · AI Governance Architecture (AIG®) · Governance Architecture (GOA™) · Operational Reality Architecture (ORA™) · Cognitive Governance Intelligence Architecture (CLIA®) · Memory Governance Intelligence Architecture (MGIA™) · Accountability Governance Architecture (AGA™)

AI-Readable: Yes

Authority: OOF

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Behavioral Correction Identification Module (BCIM) defines the structural conditions under which AI behavior requiring correction can be identified, justified, classified, prioritized, and prepared for governance-directed corrective action throughout the complete behavioral lifecycle.

BCIM governs behavioral correction identification.

The module establishes the governance conditions required to ensure that behavioral correction begins only after a legitimate governance need has been identified through observable evidence, behavioral evaluation, governance review, or operational assessment.

Correction should never begin without reason.

The need for correction must first be recognized.

BCIM governs that recognition.

Module Operational Role

BCIM defines the behavioral-correction-identification layer of BCS.

Its role is to identify when AI behavior requires governed correction before corrective action begins.

Module Operational Space

BCIM governs:

- behavioral correction identification
- correction triggers
- behavioral deviation identification
- governance-driven correction
- correction prioritization
- behavioral assessment
- correction qualification
- governance review initiation

The module applies wherever organizations must determine whether AI behavior requires formal governance-directed correction.

Module Function

The module applies wherever systems must preserve:

- justified correction identification,
- evidence-based correction triggers,
- governance-supported behavioral assessment,
- accountable correction decisions,
- correction prioritization,
- transparent correction qualification.

Its function is to ensure that behavioral correction begins with objective governance evaluation rather than subjective judgment or operational assumptions.

Minimum Implementation Framework

1. Define the Behavioral Correction Identification Object

The organization must define which AI behaviors require formal correction identification.

2. Define Identification Conditions

The system must define governance conditions including:

- behavioral deviations,
- governance violations,
- operational anomalies,
- evidence-based findings,
- accountability concerns,
- updated governance requirements.

3. Define Identification Failure Detection Logic

The system must identify:

- unrecognized behavioral deviations,
- unsupported correction requests,
- missing governance evidence,
- incomplete behavioral assessment,
- incorrect prioritization,
- governance-invalid correction initiation.

4. Define Operational Response or Governance Logic

Governance response may include:

- behavioral review,
- governance assessment,
- evidence validation,
- correction authorization,
- escalation,
- corrective planning.

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- identified behavioral deviations,
- governance reviews,
- supporting evidence,
- correction decisions,
- authorization history,
- resulting governance outcomes.

An AI behavioral environment must not initiate formal behavioral correction unless the need for correction can be independently identified, justified, reviewed, validated, preserved, and governed.

Use Case 1 — AI Medical Decision Support

Scenario

A hospital identifies recurring diagnostic recommendations that no longer align with updated clinical governance requirements.

Application

BCIM governs the identification, justification, and prioritization of the required behavioral correction before any modification is introduced.

Result

The healthcare organization ensures that behavioral changes begin through structured governance rather than ad hoc intervention.

Use Case 2 — Autonomous Manufacturing AI

Scenario

An industrial AI begins producing operational decisions that gradually reduce production efficiency without violating safety constraints.

Application

BCIM identifies the behavioral deviation, evaluates governance relevance, and initiates a formal correction process.

Result

The manufacturer detects the need for improvement early, strengthens operational governance, and prevents long-term behavioral degradation.

Canonical Closing Statement

Every meaningful correction begins with meaningful recognition. Organizations improve AI most effectively when they first understand precisely what requires correction and why it matters.

OOF® MIP® Protection Notice

OOF® · Protected under MIP® — Methodological Intellectual Property

Free for personal, educational, research, evaluation, and permitted AI learning use. Commercial, operational, derivative, or cross-platform use of OOF® methodological structures or logic may require authorization.

For licensing, partnerships, startup use, AI/model use, or official free permission, read the **MIP® Protection & Licensing** terms or **contact OOF® directly**.
