

Behavioral Legitimacy Module - (BLM)

OOF™ Origin Open Foundation™
Independent Methodological Authority

OriginID: OOF-OID-AIG-BIS-BLM-2026-06-26-0004

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: AI Governance Architecture (AIG®)

Operational Layer: AI Behavioral Governance Layer

Governed Space: Behavioral Legitimacy

Category: AI Governance

Subcategory: AI Behavioral Governance

Type: Behavioral Integrity Standard Module

Parent Standard: Behavioral Integrity Standard (BIS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 26 June 2026

Compatibility: OOF Methodology OS · AI Governance Architecture (AIG®) · Governance Architecture (GOA™) · Cognitive Governance Intelligence Architecture (CLIA®) · Memory Governance Intelligence Architecture (MGIA™) · Accountability Governance Architecture (AGA™)

AI-Readable: Yes

Authority: OOF

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Behavioral Legitimacy Module (BLM) defines the structural conditions under which AI behavior remains authorized, policy-compliant, governance-aligned, explainable, traceable, governable, observable, and operationally legitimate throughout the behavioral lifecycle.

BLM governs behavioral legitimacy.

The module establishes the foundational conditions required to ensure that AI behavior remains within approved governance objectives, organizational policies, legal requirements, ethical constraints, and authorized operational boundaries.

AI behavior may be technically correct.

AI behavior must also be legitimately authorized.

BLM governs that legitimacy.

Module Operational Role

BLM defines the behavioral-legitimacy layer of BIS.

Its role is to preserve the legitimacy of AI behavior throughout operational execution.

Module Operational Space

BLM governs:

- behavioral legitimacy
- behavioral authorization
- policy-compliant behavior
- governance-aligned behavior
- behavioral conformity
- behavioral authorization validation
- behavioral legitimacy monitoring
- behavioral governance assurance

The module applies wherever AI behavior must remain legitimate under established governance rules.

Module Function

The module applies wherever systems must preserve:

- authorized AI behavior
- governance-compliant behavior
- policy-aligned behavior
- traceable behavioral authorization
- governance-valid behavioral legitimacy
- operational behavioral trust

Its function is to ensure that AI behavior remains both operationally effective and governance-legitimate.

Minimum Implementation Framework

1. Define the Behavioral Legitimacy Object

The organization must define which AI behaviors require legitimacy governance. This may include:

- autonomous decisions
 - conversational behavior
 - recommendations
 - robotic actions
 - Human-AI interactions
 - multi-agent coordination
-

- automated workflows
- adaptive operational behavior

2. Define Behavioral Legitimacy Conditions

The system must define the conditions under which behavioral legitimacy remains valid.

This includes:

- authorization requirements
- policy requirements
- governance requirements
- traceability requirements
- validation requirements
- governance-valid legitimacy conditions

3. Define Behavioral Legitimacy Degradation Detection Logic

The system must define how behavioral illegitimacy is identified.

This may include:

- unauthorized behavior
- policy violations
- governance deviations
- behavioral boundary violations
- unauthorized autonomous adaptation
- governance-invalid behavioral activities

4. Define Operational Response or Governance Logic

The system must define governance logic for behavioral-legitimacy failures.

Governance response may include:

- legitimacy review
- policy validation
- behavioral correction
- governance intervention
- authorization reassessment
- operational suspension
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- behavioral authorizations
- governance reviews
- policy validations
- legitimacy assessments

- governance interventions
- resulting behavioral states

An AI behavioral environment must not remain integrity-valid if materially significant behavioral-legitimacy activities cannot be reconstructed, reviewed, validated, preserved, or governed.

Use Case 1 — AI Healthcare Assistant

Scenario

An AI healthcare assistant recommends treatment options while operating under medical governance policies and regulatory requirements.

Application

BLM governs behavioral legitimacy, policy compliance, governance validation, and authorization control.

Result

The healthcare organization strengthens patient safety, regulatory compliance, governance trust, and operational accountability.

Use Case 2 — Autonomous Government AI

Scenario

An AI system assists public administration by making administrative recommendations that must remain within legally authorized governance boundaries.

Application

BLM governs behavioral legitimacy, legal authorization, governance compliance, and behavioral validation.

Result

The government organization improves trustworthy AI deployment, preserves legal compliance, strengthens governance oversight, and reduces unauthorized AI behavior.

Canonical Closing Statement

Behavioral Legitimacy Module (BLM) defines the structural conditions under which AI behavior remains authorized, policy-compliant, governance-aligned, explainable, traceable, governable, observable, and operationally legitimate throughout the behavioral lifecycle.

AI behavior is not trustworthy merely because it functions correctly. It becomes trustworthy when it remains legitimate. Behavioral Legitimacy

therefore becomes a foundational condition of Behavioral Integrity within AI Governance Architecture (AIG®).
