

Behavioral Risk Detection Module - (BRDM)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-AIG-BSS-BRDM-2026-06-26-0002

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: AI Governance Architecture (AIG®)

Operational Layer: AI Behavioral Governance Layer

Governed Space: Behavioral Risk Detection

Category: Governance & Enforcement

Subcategory: AI Behavioral Safety Governance

Type: Behavioral Safety Standard Module

Parent Standard: Behavioral Safety Standard (BSS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 26 June 2026

Compatibility: OOF Methodology OS · AI Governance Architecture (AIG®) · Governance Architecture (GOA™) · Operational Reality Architecture (ORA™) · Cognitive Governance Intelligence Architecture (CLIA®) · Memory Governance Intelligence Architecture (MGIA™) · Accountability Governance Architecture (AGA™)

AI-Readable: Yes

Authority: OOF

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Behavioral Risk Detection Module (BRDM) defines the structural conditions under which behavioral risks are identified, evaluated, classified, and governed before they develop into unsafe AI behavior or operational harm.

BRDM governs behavioral risk detection.

The module establishes the governance conditions required to ensure that emerging behavioral risks become visible early enough to enable timely governance intervention and risk mitigation.

Unsafe behavior rarely appears without warning.

Behavioral risks usually appear first.

BRDM governs the identification of those risks.

Module Operational Role

BRDM defines the behavioral-risk-detection layer of BSS.

Its role is to detect emerging behavioral risks before they compromise behavioral safety.

Module Operational Space

BRDM governs:

- behavioral risk detection
- behavioral hazard identification
- emerging behavioral risks
- governance risk detection
- operational risk observation
- safety risk recognition
- behavioral anomaly detection
- preventive governance

The module applies wherever organizations must identify behavioral risks before unsafe behavior occurs.

Module Function

The module applies wherever systems must preserve:

- early behavioral risk detection,
- governance-supported risk identification,
- operational awareness,
- evidence-based risk evaluation,
- accountable risk management,
- preventive behavioral governance.

Its function is to ensure that behavioral risks are governed before they become behavioral failures.

Minimum Implementation Framework

1. Define the Behavioral Risk Detection Object

The organization must define which AI behaviors require continuous behavioral risk detection.

2. Define Detection Conditions

The system must define governance conditions including:

- behavioral anomalies,
- emerging operational risks,
- governance deviations,

- accountability concerns,
- evidence indicators,
- safety thresholds.

3. Define Detection Failure Logic

The system must identify:

- undetected behavioral risks,
- hidden governance failures,
- unsafe behavioral trends,
- delayed risk recognition,
- operational vulnerabilities,
- governance-invalid risk conditions.

4. Define Operational Response or Governance Logic

Governance response may include:

- behavioral risk assessment,
- governance review,
- preventive intervention,
- escalation,
- operational restrictions,
- corrective planning.

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- detected behavioral risks,
- governance reviews,
- supporting evidence,
- mitigation decisions,
- intervention activities,
- resulting governance outcomes.

An AI behavioral environment must not be considered behaviorally safe if materially significant behavioral risks cannot be independently detected, reviewed, validated, preserved, and governed.

Use Case 1 — Autonomous Hospital Monitoring

Scenario

An AI continuously monitors intensive care patients and supports clinical decision-making.

Application

BRDM identifies emerging behavioral risks before unsafe recommendations influence patient care.

Result

The hospital strengthens patient safety, improves governance responsiveness, and reduces preventable clinical risks.

Use Case 2 — Autonomous Industrial Operations

Scenario

An AI supervises automated production equipment operating without continuous human intervention.

Application

BRDM continuously detects emerging behavioral risks before operational conditions develop into safety incidents.

Result

The manufacturer reduces operational hazards, strengthens governance oversight, and preserves long-term behavioral safety.

Canonical Closing Statement

Safety begins long before harm occurs. Organizations that recognize behavioral risks early create the opportunity to prevent failures before they become irreversible consequences.

OOF® MIP® Protection Notice

OOF® · Protected under MIP® — Methodological Intellectual Property

Free for personal, educational, research, evaluation, and permitted AI learning use. Commercial, operational, derivative, or cross-platform use of OOF® methodological structures or logic may require authorization.
