

Behavioral Scope Module - (BSM)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-AIG-BBS-BSM-2026-06-26-0001

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: AI Governance Architecture (AIG®)

Operational Layer: AI Behavioral Governance Layer

Governed Space: Behavioral Scope

Category: AI Governance

Subcategory: AI Behavioral Governance

Type: Behavioral Boundary Standard Module

Parent Standard: Behavioral Boundary Standard (BBS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 26 June 2026

Compatibility: OOF Methodology OS · AI Governance Architecture (AIG®) · Governance Architecture (GOA™) · Operational Reality Architecture (ORA™) · Cognitive Governance Intelligence Architecture (CLIA®) · Memory Governance Intelligence Architecture (MGIA™)

AI-Readable: Yes

Authority: OOF

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Behavioral Scope Module (BSM) defines the structural conditions under which the authorized scope of AI behavior remains clearly defined, measurable, governable, traceable, enforceable, and operationally valid throughout the complete behavioral lifecycle.

BSM governs behavioral scope.

The module establishes the foundational conditions required to ensure that AI systems operate only within explicitly approved behavioral domains, functions, responsibilities, and operational objectives.

AI may perform many behaviors.

Only authorized behaviors belong within its behavioral scope.

BSM governs that scope.

Module Operational Role

BSM defines the behavioral-scope layer of BBS.

Its role is to establish and preserve the authorized scope of AI behavior.

Module Operational Space

BSM governs:

- behavioral scope
- behavioral domain definition
- authorized AI functions
- behavioral responsibility limits
- operational behavioral scope
- behavioral governance boundaries
- behavioral scope validation
- behavioral scope assurance

The module applies wherever AI behavioral responsibilities must be explicitly defined.

Module Function

The module applies wherever systems must preserve:

- authorized behavioral scope
- clearly defined behavioral responsibilities
- traceable scope definitions
- governance-valid behavioral limits
- operational clarity
- trustworthy behavioral execution

Its function is to ensure that AI performs only behaviors that belong within its approved operational scope.

Minimum Implementation Framework

1. Define the Behavioral Scope Object

The organization must define which AI behaviors belong within the approved behavioral scope.

This may include:

- conversational services
 - recommendations
 - autonomous control
 - planning
 - robotic execution
 - monitoring
-

- Human-AI interaction
- multi-agent collaboration

2. Define Behavioral Scope Conditions

The system must define the conditions under which behavioral scope remains valid.

This includes:

- scope requirements
- authorization requirements
- operational requirements
- traceability requirements
- validation requirements
- governance-valid scope conditions

3. Define Behavioral Scope Degradation Detection Logic

The system must define how behavioral scope violations are identified.

This may include:

- unauthorized behavioral expansion
- execution outside approved responsibilities
- scope ambiguity
- undefined behavioral functions
- operational scope violations
- governance-invalid behavioral activities

4. Define Operational Response or Governance Logic

The system must define governance logic for behavioral-scope violations.

Governance response may include:

- scope review
- behavioral validation
- authorization reassessment
- behavioral correction
- governance intervention
- operational restriction
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- behavioral scope definitions
- governance reviews
- authorization records
- validation activities

- governance interventions
- resulting behavioral states

An AI behavioral environment must not remain boundary-valid if materially significant behavioral scope violations cannot be reconstructed, reviewed, validated, preserved, or governed.

Use Case 1 — Enterprise AI Assistant

Scenario

An enterprise AI assistant is authorized to provide internal policy guidance but is not authorized to approve financial transactions or modify corporate records.

Application

BSM governs behavioral scope, authorization boundaries, operational validation, and governance oversight.

Result

The organization prevents unauthorized AI activities, preserves governance control, strengthens operational clarity, and improves trust.

Use Case 2 — Autonomous Industrial Robot

Scenario

An autonomous robot is authorized to perform assembly operations but must never perform maintenance activities without explicit human authorization.

Application

BSM governs behavioral scope, operational responsibilities, behavioral validation, and execution boundaries.

Result

The organization maintains safe autonomous operation, prevents unauthorized behavior, strengthens governance assurance, and reduces operational risk.

Canonical Closing Statement

Behavioral Scope Module (BSM) defines the structural conditions under which the authorized scope of AI behavior remains clearly defined, measurable, governable, traceable, enforceable, and operationally valid throughout the complete behavioral lifecycle.

Behavioral boundaries begin by defining what AI is authorized to do.

Behavioral Scope therefore becomes the first operational condition of Behavioral Boundary Standard within AI Governance Architecture (AIG®).
