

Behavioral Interoperability Standard - (BIS)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-AIG-BIS-2026-06-26-0009

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: AI Governance Architecture (AIG®)

Operational Layer: AI Behavioral Governance Layer

Governed Space: AI Behavioral Interoperability

Category: Governance & Enforcement

Subcategory: AI Behavioral Interoperability Governance

Type: Parent Standard

Version: 1.0

Status: Canonical · Open Standard

Origin Date: 26 June 2026

Compatibility: AI Governance Architecture (AIG®) · Governance Architecture (GOA™) · Operational Reality Architecture (ORA™) · Cognitive Governance Intelligence Architecture (CLIA®) · Memory Governance Intelligence Architecture (MGIA™) · Accountability Governance Architecture (AGA™) · Autonomous Systems Governance Architecture (ASGA™)

AI-Readable: Yes

Authority: OOF

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Behavioral Interoperability Standard (BIS) defines the structural conditions under which AI behavior remains compatible, coordinated, predictable, governance-aligned, and operationally trustworthy while interacting with other AI systems, humans, organizations, autonomous systems, and complex operational environments throughout the complete behavioral lifecycle.

BIS governs AI behavioral interoperability.

The standard establishes the governance conditions required to ensure that behavioral interoperability preserves governance integrity, accountability, operational consistency, and trustworthy collaboration across heterogeneous environments.

Systems may interoperate technically.

Behavior must also interoperate responsibly.

BIS governs that behavioral interoperability.

Governance Flow Position

Behavioral Integrity → Behavioral Boundaries → Behavioral Escalation →
Behavioral Auditability → Behavioral Evidence → Behavioral Trust → Behavioral
Correction → Behavioral Continuity → Behavioral Interoperability → Behavioral
Safety

Standard Abstract

Future AI systems will rarely operate alone.

They will collaborate with humans, organizations, autonomous agents, robots,
digital services, and other AI systems.

Behavioral Interoperability ensures that cooperation remains governed,
predictable, accountable, and trustworthy regardless of technological
diversity.

BIS establishes the governance architecture for trustworthy behavioral
interoperability.

Operational Role

Behavioral Interoperability Standard provides the governance layer responsible
for preserving compatible, coordinated, and governance-consistent behavior
across interacting participants.

Its role is to ensure that interoperability strengthens cooperation without
weakening governance.

Operational Space

BIS governs the architecture space responsible for AI behavioral
interoperability.

The space includes:

- behavioral interoperability
- behavioral compatibility
- cross-system behavioral coordination
- Human-AI behavioral interaction
- AI-to-AI behavioral cooperation
- organizational behavioral interoperability
- governance compatibility
- collaborative behavioral consistency

This space exists because trustworthy AI increasingly depends on trustworthy
interaction rather than isolated behavior.

Why This Standard Exists

AI ecosystems continue to expand.

Organizations increasingly connect multiple AI systems across diverse operational environments.

Without governed behavioral interoperability:

- coordination fails,
- behavioral conflicts emerge,
- governance becomes fragmented,
- accountability weakens,
- operational consistency declines,
- organizational trust decreases.

BIS exists because behavioral interoperability is an independent governance space essential for scalable AI ecosystems.

Scope

This standard may be applied across:

- AI systems
 - autonomous agents
 - robotics
 - multi-agent environments
 - enterprise AI
 - healthcare AI
 - financial AI
 - industrial AI
 - government AI
 - Human-AI environments
-

Behavioral Interoperability Logic

Behavioral interoperability remains governance-valid when AI behavior is:

- compatible,
 - coordinated,
 - predictable,
 - accountable,
 - governance-aligned,
 - operationally consistent.
-

Behavioral Interoperability Failure Rule

Behavioral interoperability fails when interacting participants can no longer preserve compatible behavior, governance consistency, accountability, or

operational coordination.

Relationship to Other OOF® Architectures

BIS governs AI behavioral interoperability.

It interoperates with:

- GOA™ — Governance
- ORA™ — Operational Reality
- CLIA® — Cognition
- MGIA™ — Memory
- AGA™ — Accountability
- ASGA™ — Autonomous Systems

Together these architectures establish the governance foundation required for trustworthy collaboration across AI ecosystems.

Foundational Principle

True interoperability is achieved not when systems can merely communicate, but when they can behave responsibly together.

Canonical Closing Statement

The future of AI will be defined less by isolated intelligence and more by coordinated behavior. Behavioral Interoperability ensures that cooperation becomes a governed capability, allowing independent systems to create trustworthy outcomes together.

Module Architecture

→ Behavioral Compatibility Module (BCOM).

→ Behavioral Coordination Module (BCDM).

→ Behavioral Synchronization Module (BSYM).

→ Behavioral Collaboration Module (BCLM).

→ Behavioral Interoperability Assurance Module (BIAM).
