

Escalation Authority Module - (EAM)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-AIG-BES-EAM-2026-06-26-0003

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: AI Governance Architecture (AIG®)

Operational Layer: AI Behavioral Governance Layer

Governed Space: Escalation Authority

Category: AI Governance

Subcategory: AI Behavioral Governance

Type: Behavioral Escalation Standard Module

Parent Standard: Behavioral Escalation Standard (BES)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 26 June 2026

Compatibility: OOF Methodology OS · AI Governance Architecture (AIG®) · Governance Architecture (GOA™) · Accountability Governance Architecture (AGA™) ·

Operational Reality Architecture (ORA™) · Cognitive Governance Intelligence Architecture (CLIA®) · Memory Governance Intelligence Architecture (MGIA™)

AI-Readable: Yes

Authority: OOF

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Escalation Authority Module (EAM) defines the structural conditions under which AI behavioral escalation is transferred to the appropriate authority according to predefined governance roles, delegated responsibilities, operational hierarchies, authorization rules, and escalation policies throughout the complete behavioral lifecycle.

EAM governs escalation authority.

The module establishes the foundational conditions required to ensure that every escalation reaches the correct decision-maker capable of assuming responsibility and exercising legitimate governance authority.

Escalation without authority creates uncertainty.

Escalation must always reach the appropriate authority.

EAM governs that authority.

Module Operational Role

EAM defines the escalation-authority layer of BES.

Its role is to ensure that AI behavioral escalation reaches the correct governance authority.

Module Operational Space

EAM governs:

- escalation authority
- authority transfer
- governance authority
- delegated authority
- escalation routing
- Human-AI authority transition
- escalation authorization
- authority validation

The module applies wherever AI behavioral escalation requires transfer of authority.

Module Function

The module applies wherever systems must preserve:

- legitimate escalation authority
- correct authority assignment
- traceable authority transfer
- governance-valid intervention
- accountable escalation
- trustworthy governance execution

Its function is to ensure that escalation is always directed to the person, role, organization, or AI governance entity with legitimate authority to act.

Minimum Implementation Framework

1. Define Escalation Authorities

The organization must define all authorities authorized to receive AI behavioral escalations.

This may include:

- human operators
 - supervisors
 - governance officers
 - safety managers
 - incident response teams
-

- executive authorities
- regulatory authorities
- authorized autonomous supervisory systems

2. Define Authority Assignment Rules

The system must define which authority is responsible for each escalation category.

3. Define Authority Selection Logic

The system must determine the appropriate escalation authority based on operational context, severity, governance policy, and delegated responsibilities.

4. Define Governance Response

The organization must define governance actions following successful authority transfer.

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- escalation authority assignments
- authority transfer events
- governance reviews
- intervention decisions
- resulting behavioral states

An AI behavioral environment must not remain escalation-valid if materially significant authority-transfer activities cannot be reconstructed, reviewed, validated, preserved, or governed.

Use Case 1 — Autonomous Hospital AI

Scenario

An AI clinical assistant identifies a life-threatening condition beyond its delegated authority.

Application

EAM governs the transfer of escalation to the responsible emergency physician according to predefined governance rules.

Result

The hospital preserves accountability, accelerates critical response, strengthens governance, and improves patient safety.

Use Case 2 — Autonomous Manufacturing System

Scenario

An industrial AI detects abnormal production behavior requiring immediate operational intervention.

Application

EAM governs escalation routing to the authorized production supervisor responsible for operational decisions.

Result

The organization reduces operational downtime, preserves governance authority, improves accountability, and strengthens Human-AI operational coordination.

Canonical Closing Statement

Escalation Authority Module (EAM) defines the structural conditions under which AI behavioral escalation is transferred to the appropriate authority according to predefined governance roles, delegated responsibilities, operational hierarchies, authorization rules, and escalation policies throughout the complete behavioral lifecycle.

Recognizing the need for escalation is insufficient unless escalation reaches the correct authority. Escalation Authority therefore becomes a foundational operational condition of Behavioral Escalation Standard within AI Governance Architecture (AIG®).
