

Escalation Timing Module - (EtiM)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-AIG-BES-ETM-2026-06-26-0002

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: AI Governance Architecture (AIG®)

Operational Layer: AI Behavioral Governance Layer

Governed Space: Escalation Timing

Category: AI Governance

Subcategory: AI Behavioral Governance

Type: Behavioral Escalation Standard Module

Parent Standard: Behavioral Escalation Standard (BES)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 26 June 2026

Compatibility: OOF Methodology OS · AI Governance Architecture (AIG®) · Governance Architecture (GOA™) · Operational Reality Architecture (ORA™) · Cognitive Governance Intelligence Architecture (CLIA®) · Memory Governance Intelligence Architecture (MGIA™) · Accountability Governance Architecture (AGA™)

AI-Readable: Yes

Authority: OOF

Protection: MIP™ — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Escalation Timing Module (EtiM) defines the structural conditions under which AI behavioral escalation occurs at the appropriate moment according to predefined governance thresholds, operational conditions, behavioral risk levels, confidence limits, and escalation policies throughout the complete behavioral lifecycle.

ETM governs escalation timing.

The module establishes the foundational conditions required to ensure that escalation occurs neither too early nor too late, preserving operational effectiveness while preventing unnecessary risk or delayed intervention.

Correct escalation is not only about whether escalation occurs.

It is also about when escalation occurs.

ETM governs that timing.

Module Operational Role

ETM defines the escalation-timing layer of BES.

Its role is to preserve the correct timing of AI behavioral escalation.

Module Operational Space

ETM governs:

- escalation timing
- escalation scheduling
- intervention timing
- governance timing thresholds
- behavioral timing evaluation
- operational response timing
- escalation sequencing
- escalation timing validation

The module applies wherever AI behavioral escalation depends on appropriate timing.

Module Function

The module applies wherever systems must preserve:

- timely escalation
- governance-valid intervention
- operationally appropriate escalation
- traceable escalation timing
- behavioral timing consistency
- trustworthy escalation execution

Its function is to ensure that escalation occurs at the optimal governance moment based on predefined operational conditions.

Minimum Implementation Framework

1. Define Escalation Timing Conditions

The organization must define when escalation should occur.

2. Define Timing Thresholds

The system must define measurable timing criteria for escalation.

3. Define Timing Evaluation Logic

The system must continuously evaluate whether escalation timing conditions have been reached.

4. Define Governance Response

The organization must specify governance actions for early, delayed, or correctly timed escalation.

5. Preserve Traceability

The system must preserve complete traceability of:

- escalation timing decisions,
- trigger timestamps,
- governance evaluations,
- intervention timing,
- resulting behavioral states.

Use Case 1 — Autonomous Vehicle

Scenario

An autonomous vehicle detects deteriorating weather conditions and escalating uncertainty.

Application

ETM governs the exact point at which vehicle control is escalated to the human driver or remote operations center.

Result

The organization reduces safety risk, improves operational trust, and preserves governance integrity.

Use Case 2 — AI Clinical Decision Support

Scenario

A clinical AI identifies a rapidly deteriorating patient while confidence in treatment recommendations decreases.

Application

ETM governs the precise timing for escalating the case to a physician before patient safety is compromised.

Result

The healthcare organization improves patient safety, reduces clinical risk, and strengthens Human-AI governance.

Canonical Closing Statement

Escalation Timing Module (EtiM) defines the structural conditions under which AI behavioral escalation occurs at the appropriate moment according to predefined governance thresholds, operational conditions, behavioral risk levels, confidence limits, and escalation policies throughout the complete behavioral lifecycle.

A correct escalation delivered too late may become ineffective. Escalation Timing therefore becomes a foundational operational condition of Behavioral Escalation Standard within AI Governance Architecture (AIG®).
