

BCM — Boundary Conflict Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-GOA-GBS-BCM-2026-06-22-0003

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Governance Architecture (GOA™)

Operational Layer: Governance Boundary Governance Layer

Governed Space: Governance Boundary Conflict

Category: Governance & Enforcement

Subcategory: Governance Boundary Governance

Type: Governance Boundary Standard Module

Parent Standard: Governance Boundary Standard (GBS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 22 June 2026

Compatibility: OOF Methodology OS · Governance Boundary Standard (GBS)

· Governance Authority Standard (GAS) · Governance Scope Standard (GSS)

· INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Boundary Conflict Module (BCM) defines the structural conditions under which governance-boundary conflicts remain identifiable, attributable, traceable, reviewable, governable, resolvable, auditable, and operationally valid throughout the governance lifecycle.

BCM governs governance-boundary conflicts.

The module establishes the foundational conditions required to determine where governance boundaries overlap, where governance jurisdictions conflict, how governance-boundary disputes emerge, and whether governance-boundary conflicts remain reconstructable throughout operational reality.

Governance boundaries may exist.

Governance boundaries may also conflict.

BCM governs those conflicts.

Module Operational Role

BCM defines the boundary-conflict governance layer of GBS.

Its role is to establish governance-valid conflict visibility throughout governance environments.

Module Operational Space

BCM governs:

- governance-boundary conflicts
- governance-jurisdiction conflicts
- governance-boundary overlap
- governance-authority disputes
- governance-limit conflicts
- governance-boundary auditability
- governance-boundary traceability
- governance-conflict reconstruction

The module applies wherever governance boundaries may overlap, collide, or become disputed.

Module Function

The module applies wherever systems must preserve:

- identifiable governance conflicts
- traceable governance disputes
- reconstructable conflict history
- attributable conflict ownership
- governance-valid conflict records
- operational conflict visibility

Its function is to ensure that governance can identify, reconstruct, and govern governance-boundary conflicts throughout operational reality.

Minimum Implementation Framework

1. Define the Boundary Conflict Object

The organization must define which governance environments require governance-boundary conflict governance.

This may include:

- organizations
- institutions
- governments
- regulatory environments
- multi-department governance structures
- AI governance systems
- autonomous-agent ecosystems
- Human-AI governance environments

2. Define Boundary Conflict Conditions

The system must define the conditions under which governance-boundary conflicts remain validly identifiable.
This includes:

- conflict-identification requirements
- jurisdiction requirements
- attribution requirements
- traceability requirements
- review requirements
- governance-valid conflict conditions

3. Define Conflict Degradation Detection Logic

The system must define how governance-boundary conflict failures are identified.
This may include:

- hidden governance conflicts
- overlapping jurisdictions
- unresolved authority disputes
- governance-boundary ambiguity
- missing conflict records
- governance-invalid conflict activities

4. Define Operational Response or Governance Logic

The system must define governance logic for governance-boundary conflicts.
Governance response may include:

- conflict review
- conflict validation
- governance intervention
- conflict resolution procedures
- conflict reconstruction
- jurisdiction verification
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- governance conflicts
- conflict reviews
- intervention procedures
- validation activities
- conflict-resolution actions
- resulting governance states

A governance environment must not remain conflict-valid if materially significant governance conflicts cannot be reconstructed, reviewed, attributed, resolved, preserved, or governed.

Use Case 1 — Multi-Department Governance Environment

Scenario

Two departments claim governance authority over the same operational activity.

Application

BCM identifies overlapping governance jurisdictions, reconstructs governance ownership claims, and governs conflict-resolution procedures.

Result

The organization gains clearer governance ownership, reduced governance ambiguity, and improved governance coordination.

Use Case 2 — Human-AI Governance Environment

Scenario

Human governance actors and AI governance systems produce conflicting governance decisions within the same governance domain.

Application

BCM governs governance-boundary conflict identification, authority attribution, and conflict-resolution activities.

Result

The organization gains stronger governance visibility, reduced governance ambiguity, and improved Human-AI governance coordination.

Canonical Closing Statement

Boundary Conflict Module (BCM) defines the structural conditions under which governance-boundary conflicts remain identifiable, attributable, traceable, reviewable, governable, resolvable, auditable, and operationally valid throughout the governance lifecycle.

Governance boundaries that cannot resolve conflicts cannot remain governance-valid. Boundary Conflict therefore becomes a foundational condition of trustworthy governance boundary governance.
