

CCFIM — Cognitive Conflict Integrity Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-AI-CCFIM-2026-06-03-0001

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Cognitive Governance Intelligence Architecture (CLIA®)

Operational Layer: Multi-Agent Cognition Governance Layer

Governed Space: Cognitive Conflict Integrity

Category: AI & Interpretation

Subcategory: Cognitive Conflict Governance

Type: Multi-Agent Cognition Integrity Module

Parent Standard: Multi-Agent Cognition Integrity Standard (MCIS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 3 June 2026

Compatibility: OOF Methodology OS ·

Multi-Agent Cognition Integrity Standard (MCIS) ·

Agent Cognition Integrity Standard (ACIS) ·

Cognitive Synchronization Integrity Module (CSIM) ·

Cognitive Coordination Integrity Module (CCIM) ·

Multi-Layer Truth Validation Framework (MTVF) ·

INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Cognitive Conflict Integrity Module (CCFIM) defines the structural conditions under which conflicting cognition, contradictory reasoning, competing objectives, interpretation disagreements, decision conflicts, and distributed cognition inconsistencies remain detectable, traceable, governable, and operationally valid across multi-agent cognition environments.

CCFIM governs cognitive conflict.

The module ensures that conflicts between agents become visible governance objects rather than hidden sources of collective cognition instability.

A system satisfies CCFIM only if:

- cognitive conflicts remain detectable
- conflicting reasoning remains traceable
- contradiction sources remain identifiable
- conflict resolution remains governable

- unresolved conflicts remain visible
- collective cognition remains protected from hidden contradiction accumulation

A multi-agent cognition environment that cannot identify, govern, or resolve materially significant cognitive conflicts does not satisfy CCFIM.

Module Operational Role

CCFIM defines the cognitive-conflict governance layer of MCIS.

Its role is to preserve collective cognition validity whenever disagreement emerges between autonomous agents.

Module Operational Space

CCFIM governs:

- cognitive conflicts
- reasoning contradictions
- objective conflicts
- interpretation disagreements
- distributed cognition inconsistencies
- conflict traceability
- conflict governance
- contradiction resolution

The module applies wherever multiple agents participate in collective cognition and may arrive at conflicting conclusions.

Module Function

The module applies wherever systems must preserve:

- visible disagreement
- governable conflict
- contradiction awareness
- collective cognition stability
- traceable conflict resolution
- governance-valid consensus formation

Its function is to ensure that cognitive disagreement strengthens governance visibility rather than weakening collective cognition validity.

Minimum Implementation Framework

1. Define the Cognitive Conflict Object

The organization must define which cognition conflicts require governance.

This may include:

- reasoning conflicts
 - planning conflicts
 - objective conflicts
 - prioritization conflicts
 - interpretation conflicts
 - execution conflicts
-

- delegation conflicts
- decision conflicts

2. Define Cognitive Conflict Conditions

The system must define the conditions under which cognitive conflict becomes operationally significant.

This includes:

- contradiction thresholds
- disagreement thresholds
- escalation requirements
- resolution requirements
- governance review requirements
- collective-validity requirements

3. Define Conflict Detection Logic

The system must define how cognitive conflicts are identified.

This may include:

- contradictory conclusions
- conflicting plans
- objective divergence
- inconsistent reasoning
- execution disagreement
- governance-alignment conflicts

4. Define Operational Response or Governance Logic

The system must define governance logic for cognitive conflict conditions.

Governance response may include:

- conflict review
- contradiction analysis
- evidence validation
- arbitration
- escalation
- coordination intervention
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- conflict events
- contradiction sources
- governance reviews
- arbitration decisions
- conflict resolutions
- operational outcomes

A multi-agent cognition environment must not remain conflict-valid if materially significant contradictions remain hidden, unresolved, or governance-invisible.

Use Case 1 — Distributed Strategic Planning Environment

Scenario

Multiple autonomous planning agents independently generate strategic recommendations regarding future operational actions.

Application

CCFIM governs contradictory recommendations, reasoning conflicts, and objective disagreements across the planning ecosystem.

Result

The organization gains stronger governance visibility, improved decision quality, and reduced risk of hidden cognition conflicts.

Use Case 2 — Autonomous Coordination Network

Scenario

A distributed multi-agent environment coordinates operational activities across logistics, monitoring, optimization, and execution systems.

Application

CCFIM governs conflict detection, contradiction resolution, and collective cognition stability during coordination activities.

Result

The environment gains stronger operational coherence, improved governance control, and reduced exposure to distributed cognition instability.

Canonical Closing Statement

Cognitive Conflict Integrity Module (CCFIM) defines the structural conditions under which conflicting cognition, contradictory reasoning, competing objectives, interpretation disagreements, decision conflicts, and distributed cognition inconsistencies remain detectable, traceable, governable, and operationally valid across multi-agent cognition environments.

Collective cognition cannot remain valid if contradictions remain invisible.
Cognitive conflict therefore becomes a foundational integrity condition of governable multi-agent cognition.
