

CCIM — Cognitive Continuity Integrity Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-AI-CCIM-2026-06-03-0001

Architecture Ecosystem: Cognitive Governance Intelligence Architecture (CLIA®)

Architecture Family: Core Cognition Governance

Operational Layer: Cognitive Validity Layer

Governed Space: Cognitive Continuity Integrity

Category: AI & Interpretation

Subcategory: Cognitive Continuity Governance

Type: Cognitive Integrity Module

Parent Standard: Cognitive Integrity Standard (CIS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 3 June 2026

Compatibility: OOF Methodology OS ·

Human Cognition Integrity Standard (HCIS) ·

Agent Cognition Integrity Standard (ACIS) ·

Multi-Agent Cognition Integrity Standard (MCIS) ·

INTEGROS® — Integrity Standard ·

Universal Canonical Language (UCL)

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Cognitive Continuity Integrity Module (CCIM) defines the structural conditions under which cognition remains materially continuous, traceable, state-preserving, context-preserving, and operationally stable across cognitive transitions, interactions, reasoning cycles, and evolving cognition environments.

CCIM governs cognitive continuity.

The module ensures that cognition does not become fragmented, disconnected, discontinuous, or operationally unstable as cognitive states evolve over time.

A system satisfies CCIM only if:

- cognitive continuity remains preservable
- cognitive state transitions remain traceable
- context continuity remains governable
- cognitive fragmentation remains detectable
- continuity degradation remains manageable

- cognition remains materially connected across transitions

A cognition system that loses continuity between cognitive states does not satisfy CCIM.

Module Operational Role

CCIM defines the cognitive continuity layer of CIS.

Its role is to preserve cognition validity by ensuring continuity remains materially maintained throughout cognition.

Module Operational Space

CCIM governs:

- cognitive continuity
- cognitive state transitions
- context continuity
- cognition traceability
- continuity preservation
- fragmentation detection
- continuity degradation governance
- cognition-state stability

The module applies wherever cognition persists across multiple states, interactions, reasoning cycles, or operational environments.

Module Function

The module applies wherever systems must preserve:

- continuous cognition
- stable cognitive transitions
- context preservation
- cognition-state stability
- traceable cognition evolution
- governance-valid continuity

Its function is to ensure that cognition remains materially connected rather than fragmented as cognition evolves.

Minimum Implementation Framework

1. Define the Cognitive Continuity Object

The organization must define which cognition processes require continuity governance.

This may include:

- reasoning sessions
 - autonomous cognition
 - human-AI cognition
 - agent cognition
 - collective cognition
 - long-running cognitive workflows
 - adaptive cognition environments
-

- multi-stage cognitive processes

2. Define Cognitive Continuity Conditions

The system must define the conditions under which continuity remains valid.

This includes:

- continuity requirements
- state-transition requirements
- context-preservation requirements
- fragmentation limits
- continuity-validation conditions
- stability requirements

3. Define Continuity Detection Logic

The system must define how continuity degradation is identified.

This may include:

- state-transition analysis
- fragmentation detection
- context-loss detection
- continuity monitoring
- cognition-path reconstruction
- transition-integrity assessment

4. Define Operational Response or Governance Logic

The system must define governance logic for continuity degradation conditions.

Governance response may include:

- continuity restoration
- cognition review
- context reconstruction
- escalation
- intervention activation
- continuity validation
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- cognitive states
- state transitions
- continuity events
- fragmentation events
- governance actions
- continuity restoration actions

A cognition system must not remain continuity-valid if material fragmentation or continuity loss remains unresolved.

Use Case 1 — Long-Running Autonomous Cognitive Agent

Scenario

An autonomous cognitive agent continuously operates across extended periods while performing reasoning, interpretation, and decision-support activities.

Application

CCIM governs continuity across cognitive state transitions and ensures cognition remains materially connected over time.

Result

The system gains stronger cognitive stability and reduced exposure to fragmentation-driven cognition failures.

Use Case 2 — Human-AI Collaborative Analysis Environment

Scenario

Humans and AI continuously collaborate across multiple sessions, contexts, and evolving analytical tasks.

Application

CCIM governs continuity preservation, context retention, and traceable cognitive progression across collaborative cognition processes.

Result

The environment gains stronger cognitive coherence, improved traceability, and reduced risk of discontinuous cognition.

Canonical Closing Statement

Cognitive Continuity Integrity Module (CCIM) defines the structural conditions under which cognition remains materially continuous, traceable, state-preserving, context-preserving, and operationally stable across cognitive transitions, interactions, reasoning cycles, and evolving cognition environments.

Cognition cannot remain valid if continuity collapses.
Cognitive continuity therefore becomes a foundational integrity condition of governable cognition.
