

CCIM — Cognitive Coordination Integrity Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-AI-CCIM-2026-06-03-0001

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Cognitive Governance Intelligence Architecture (CLIA®)

Operational Layer: Multi-Agent Cognition Governance Layer

Governed Space: Cognitive Coordination Integrity

Category: AI & Interpretation

Subcategory: Multi-Agent Coordination Governance

Type: Multi-Agent Cognition Integrity Module

Parent Standard: Multi-Agent Cognition Integrity Standard (MCIS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 3 June 2026

Compatibility: OOF Methodology OS ·

Agent Cognition Integrity Standard (ACIS) ·

Operational Authority Integrity Standard (OAIS) ·

Runtime Integrity Standard (RIS) ·

Operational Decision Integrity Standard (ODIS) ·

INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Cognitive Coordination Integrity Module (CCIM) defines the structural conditions under which cognition distributed across multiple autonomous agents remains operationally coordinated, role-aligned, objective-consistent, execution-synchronized, and governance-valid throughout collective reasoning, planning, delegation, communication, and execution activities.

CCIM governs cognitive coordination.

The module ensures that multiple agents do not merely communicate, but coordinate cognition toward coherent operational outcomes.

A system satisfies CCIM only if:

- coordination remains coherent
- roles remain aligned
- objectives remain consistent
- coordination failures remain detectable
- execution relationships remain governable

- collective cognition remains operationally coordinated

A multi-agent cognition environment that cannot preserve coherent coordination across interacting agents does not satisfy CCIM.

Module Operational Role

CCIM defines the coordination-governance layer of MCIS.

Its role is to preserve governance-valid coordination between autonomous cognitive entities.

Module Operational Space

CCIM governs:

- cognitive coordination
- role alignment
- objective alignment
- execution coordination
- coordination governance
- inter-agent collaboration
- coordination traceability
- collective operational coherence

The module applies wherever multiple agents coordinate cognition toward shared outcomes.

Module Function

The module applies wherever systems must preserve:

- coordinated cognition
- coherent execution
- role clarity
- objective consistency
- governance-valid collaboration
- collective operational alignment

Its function is to ensure that distributed cognition remains coordinated rather than merely connected.

Minimum Implementation Framework

1. Define the Coordination Object

The organization must define which cognition activities require coordination governance.

This may include:

- planning activities
 - workflow execution
 - task distribution
 - delegation processes
 - decision coordination
 - operational monitoring
 - collaborative reasoning
 - multi-agent execution
-

2. Define Coordination Conditions

The system must define the conditions under which coordination remains valid.

This includes:

- role requirements
- objective-alignment requirements
- execution-alignment requirements
- coordination thresholds
- collaboration requirements
- governance-valid coordination conditions

3. Define Coordination Degradation Detection Logic

The system must define how coordination degradation is identified.

This may include:

- role conflicts
- objective divergence
- coordination failures
- execution inconsistencies
- collaboration breakdowns
- governance-alignment failures

4. Define Operational Response or Governance Logic

The system must define governance logic for coordination degradation conditions.

Governance response may include:

- coordination review
- role reassignment
- objective reconciliation
- governance intervention
- escalation
- execution restriction
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- coordination events
- role assignments
- objective changes
- governance interventions
- execution decisions
- coordination outcomes

A multi-agent cognition environment must not remain coordination-valid if materially significant coordination failures cannot be detected, governed, or resolved.

Use Case 1 — Enterprise Agent Workforce

Scenario

Multiple autonomous agents coordinate planning, scheduling, reporting, execution, monitoring, and optimization activities across an organization.

Application

CCIM governs role alignment, objective consistency, and cognition coordination across the agent workforce.

Result

The organization gains stronger operational coherence, reduced coordination failures, and improved collective cognition performance.

Use Case 2 — Autonomous Supply Chain Network

Scenario

A distributed network of autonomous agents manages procurement, inventory, logistics, transportation, and operational planning.

Application

CCIM governs coordination relationships, execution alignment, and collective operational objectives across the network.

Result

The environment gains stronger coordination integrity, reduced operational conflicts, and improved distributed decision-making.

Canonical Closing Statement

Cognitive Coordination Integrity Module (CCIM) defines the structural conditions under which cognition distributed across multiple autonomous agents remains operationally coordinated, role-aligned, objective-consistent, execution-synchronized, and governance-valid throughout collective reasoning, planning, delegation, communication, and execution activities.

Collective cognition cannot remain valid if coordination collapses.
Cognitive coordination therefore becomes a foundational integrity condition of governable multi-agent cognition.
