

CFIM — Consensus Formation Integrity Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-AI-CFIM-2026-06-05-0004

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Cognitive Governance Intelligence Architecture (CLIA®)

Operational Layer: Collective Cognition Governance Layer

Governed Space: Consensus Formation Integrity

Category: AI & Interpretation

Subcategory: Consensus Governance

Type: Collective Cognition Integrity Module

Parent Standard: Collective Cognition Integrity Standard (CCIS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 5 June 2026

Compatibility: OOF Methodology OS ·
Collective Cognition Integrity Standard (CCIS) ·
Organizational Cognition Integrity Module (OCIM) ·
Institutional Cognition Integrity Module (ICIM) ·
Distributed Cognition Integrity Module (DCIM) ·
Cognitive Interpretation Integrity Standard (CIIS) ·
Cognitive Reasoning Integrity Standard (CRIS) ·

Canonical Language: English (UCL)

Canonical Definition

Consensus Formation Integrity Module (CFIM) defines the structural conditions under which collective agreement, shared understanding, group conclusions, institutional alignment, collective interpretations, and consensus-driven cognition remain traceable, accountable, reality-connected, governance-valid, and operationally reliable throughout consensus formation processes.

CFIM governs consensus formation.

The module ensures that consensus emerges through valid cognition processes rather than social pressure, authority distortion, information asymmetry, conformity effects, coordination bias, or governance-invalid agreement mechanisms.

A system satisfies CFIM only if:

- consensus formation remains traceable
- consensus conditions remain visible
- disagreement remains preservable
- consensus drivers remain identifiable
- reality alignment remains assessable
- consensus outcomes remain governance-valid

A collective environment that cannot explain how consensus emerged does not satisfy CFIM.

Module Operational Role

CFIM defines the consensus-governance layer of CCIS.

Its role is to preserve integrity in collective agreement formation.

Module Operational Space

CFIM governs:

- consensus formation
- shared understanding
- agreement generation
- collective alignment
- consensus traceability
- disagreement visibility
- consensus accountability
- collective interpretation convergence

The module applies wherever groups attempt to establish shared conclusions or coordinated understanding.

Module Function

The module applies wherever systems must preserve:

- accountable consensus
- transparent agreement formation
- reality-connected alignment
- governance-valid convergence
- disagreement visibility
- operationally reliable collective conclusions

Its function is to ensure that collective agreement remains cognitively valid rather than merely socially accepted.

Minimum Implementation Framework

1. Define the Consensus Formation Object

The organization must define which consensus processes require governance.

This may include:

- strategic alignment
 - policy formation
 - expert consensus
-

- organizational decisions
- governance agreements
- collective recommendations
- standards development
- multi-party coordination

2. Define Consensus Formation Conditions

The system must define the conditions under which consensus remains valid.

This includes:

- transparency requirements
- traceability requirements
- disagreement-preservation requirements
- accountability requirements
- reality-alignment requirements
- governance-valid consensus conditions

3. Define Consensus Degradation Detection Logic

The system must define how consensus degradation is identified.

This may include:

- authority-driven agreement
- conformity pressure
- information suppression
- artificial alignment
- disagreement concealment
- consensus-reality divergence

4. Define Operational Response or Governance Logic

The system must define governance logic for consensus-integrity failures.

Governance response may include:

- consensus review
- disagreement analysis
- evidence reassessment
- governance intervention
- escalation
- consensus suspension
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- consensus drivers
- participant inputs
- disagreement records
- governance reviews
- intervention actions
- resulting consensus outcomes

A collective environment must not remain consensus-valid if materially significant agreement conditions cannot be reconstructed, reviewed, or governed.

Use Case 1 — International Standards Development Body

Scenario

Experts from multiple countries, industries, and institutions collaborate

to establish globally accepted standards.

Application

CFIM governs how consensus emerges, how disagreements are handled, and how collective conclusions remain traceable and reality-connected.

Result

The organization gains stronger consensus legitimacy, improved transparency, and reduced exposure to groupthink-driven outcomes.

Use Case 2 — Multi-Agent Decision Environment

Scenario

A network of autonomous agents must establish shared operational conclusions before executing coordinated actions.

Application

CFIM governs consensus formation, agreement accountability, and collective cognition validity across the agent ecosystem.

Result

The environment gains stronger coordination reliability, improved decision legitimacy, and reduced exposure to artificial consensus failures.

Canonical Closing Statement

Consensus Formation Integrity Module (CFIM) defines the structural conditions under which collective agreement, shared understanding, group conclusions, institutional alignment, collective interpretations, and consensus-driven cognition remain traceable, accountable, reality-connected, governance-valid, and operationally reliable throughout consensus formation processes.

Consensus is not valid merely because agreement exists.

Consensus becomes valid only when agreement emerges through traceable, accountable, reality-connected, and governance-valid cognition processes.
