

Cognitive Interpretation Integrity Standard (CIIS)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-AI-CIIS-2026-06-03-0001

Category: AI & Interpretation

Subcategory: Cognitive Interpretation Governance Architecture

Type: Parent Standard

Version: 1.0

Status: Canonical · Open Standard

Origin Date: 3 June 2026

Compatibility: OOF Methodology OS ·

Cognitive Integrity Standard (CIS) ·

Agent Cognition Integrity Standard (ACIS) ·

Multi-Agent Cognition Integrity Standard (MCIS) ·

Multi-Layer Truth Validation Framework (MTVF) ·

Universal Canonical Language (UCL) ·

Ethical Virtual Integrity Protocol (EVIP) ·

INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Cognitive Interpretation Integrity Standard (CIIS) defines the structural conditions under which signals, context, instructions, intentions, observations, events, and operational reality inputs are interpreted into meaning in a manner that remains traceable, contextually valid, semantically coherent, governance-compatible, and operationally reliable across human, agent, and multi-agent cognition environments.

CIIS governs interpretation.

The standard ensures that cognition remains capable of transforming inputs into valid meaning without producing uncontrolled semantic distortion, interpretation drift, ambiguity collapse, context corruption, or governance-invalid conclusions.

Interpretation is the bridge between information and meaning.

CIIS governs the integrity of that bridge.

A. Standard Abstract

Every cognition system interprets.

Humans interpret.

Agents interpret.

Multi-agent systems interpret.

Organizations interpret.

Institutions interpret.

Future autonomous ecosystems will continuously interpret:

- signals
- instructions
- context
- intentions
- observations
- events
- environmental conditions
- operational reality

Most systems focus on:

- information processing
- reasoning
- execution
- decision-making

However, before any reasoning occurs, interpretation has already happened.

Meaning emerges through interpretation.

This creates a critical governance challenge.

A system may possess:

- accurate information
- valid memory
- strong reasoning capability
- reliable execution

while interpretation underneath becomes:

- contextually invalid
- semantically unstable
- ambiguity-blind
- meaning-distorted
- governance-incompatible

CIIS exists to govern that condition.

B. Core Principle

Cognition is not governed solely by what information it receives,

but by how that information becomes meaning.

Interpretation becomes valid only when meaning remains traceable,

contextually anchored, semantically coherent, and governance-compatible throughout cognition.

C. Scope

This standard may apply to:

- human cognition systems
- AI systems
- autonomous agents
- multi-agent environments
- organizational decision environments
- cognitive assistants
- interpretation engines
- knowledge systems
- governance systems
- future autonomous ecosystems

CIIS applies wherever meaning is derived from information through interpretation.

D. Why This Standard Exists

Most cognition failures do not begin with reasoning.

They begin with interpretation.

A signal may be valid.

A memory may be accurate.

A fact may be correct.

Yet interpretation may transform those inputs into invalid meaning.

Traditional systems often ask:

Was the information correct?

CIIS asks a deeper question:

Was the meaning constructed correctly from the information?

As AI systems become increasingly autonomous, interpretation becomes one of the most important governable spaces in cognition.

CIIS exists because interpretation determines what cognition believes reality means.

E. Cognitive Interpretation Integrity Logic

Interpretation integrity exists only when the following remain materially preservable:

1. Signal Interpretation Integrity

Signals remain interpreted in a materially valid manner.

2. Context Interpretation Integrity

Interpretation remains appropriately anchored to context.

3. Intent Interpretation Integrity

Intentions remain interpreted according to legitimate meaning conditions.

4. Ambiguity Interpretation Integrity

Ambiguity remains detectable, visible, and governable.

5. Meaning Construction Integrity

Meaning remains semantically coherent and operationally valid.

F. Operational Architecture Space

CIIS defines the operational architecture space for:

- interpretation governance
- signal interpretation
- context interpretation
- intent interpretation
- ambiguity governance
- semantic interpretation
- meaning construction
- interpretation traceability
- interpretation validity

This space exists because meaning does not emerge automatically from information.

Meaning emerges through interpretation.

CIIS governs whether that interpretation remains valid.

G. Difference Between Information and Interpretation

Information and interpretation are related but structurally distinct.

Information governs:

- signals
- observations
- facts
- inputs
- events

Interpretation governs:

- meaning
- understanding
- semantic construction
- contextual relevance
- ambiguity resolution
- significance assignment

Two systems may receive identical information and produce different meanings.

CIIS governs the process that creates those meanings.

H. Runtime Position

CIIS operates within the Cognitive Interpretation Governance Layer of CLIA®.

It provides governance conditions for how cognition transforms information into meaning before reasoning, planning, decision-making, and execution occur.

CIIS therefore sits upstream of many downstream cognition activities.

I. Interpretation Drift Rule

Interpretation drift occurs when meaning progressively diverges from governance-valid interpretation conditions while cognition continues assuming the interpretation remains correct.

This may include:

- context drift
- semantic drift
- ambiguity collapse
- intent distortion
- signal misinterpretation
- meaning inflation
- meaning degradation
- interpretation bias

A cognition system may therefore preserve operational functionality while interpretation validity underneath progressively deteriorates.

CIIS exists to expose and govern that condition.

J. Validity Logic

A cognition environment is valid under CIIS when:

- interpretation remains traceable
- meaning remains coherent
- context remains preserved
- ambiguity remains governable
- intent remains correctly interpreted
- semantic stability remains preserved
- interpretation remains operationally valid

A cognition environment becomes invalid under CIIS when:

- meaning becomes semantically unstable
 - context becomes disconnected
 - ambiguity becomes invisible
 - interpretation becomes unreconstructable
 - intent becomes distorted
 - semantic drift becomes uncontrolled
 - interpretation loses governance validity
-

K. Relationship to Other OOF Standards

CIIS operates naturally with:

- Cognitive Integrity Standard (CIS)
 - Agent Cognition Integrity Standard (ACIS)
 - Multi-Agent Cognition Integrity Standard (MCIS)
 - Multi-Layer Truth Validation Framework (MTVF)
 - Universal Canonical Language (UCL)
 - Ethical Virtual Integrity Protocol (EVIP)
-

- INTEGROS® — Integrity Standard

CIIS does not replace these standards.

It governs the interpretation layer through which information becomes meaning.

L. Foundational Principle

If interpretation cannot remain traceable, contextually valid, semantically coherent, and governance-compatible, cognition may preserve information while progressively losing meaning validity.

Canonical Closing Statement

Cognitive Interpretation Integrity Standard (CIIS) defines the structural conditions under which signals, context, instructions, intentions, observations, events, and operational reality inputs are interpreted into meaning in a manner that remains traceable, contextually valid, semantically coherent, governance-compatible, and operationally reliable across human, agent, and multi-agent cognition environments.

Information alone does not govern cognition. Meaning governs cognition.

Interpretation becomes governance-valid only when meaning remains traceable, contextually anchored, semantically coherent, and operationally reliable throughout cognition.
