

Cognitive Integrity Standard (CIS)

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-AI-CIS-2026-06-03-0001

Category: AI & Interpretation

Subcategory: Cognitive Validity & Integrity Architecture

Type: Foundational Parent Standard

Version: 1.0

Status: Canonical · Open Standard

Origin Date: 3 June 2026

Compatibility: OOF Methodology OS ·
Cognitive Governance Intelligence Architecture (CLIA®) ·
Multi-Layer Truth Validation Framework (MTVF) ·
Ethical Virtual Integrity Protocol (EVIP) ·
INTEGROS® — Integrity Standard ·
Universal Canonical Language (UCL)

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Cognitive Integrity Standard (CIS) defines the structural conditions under which cognition remains valid, coherent, bounded, traceable, and governable across human cognition, AI cognition, agent cognition, collective cognition, and future cognitive architectures.

CIS governs the foundational validity of cognition itself.

Cognitive validity increasingly depends not only on outputs, intelligence level, or system capability, but on whether truth, reasoning, governance boundaries, continuity, and structural coherence remain materially preserved during cognition.

A. Standard Abstract

Future intelligence systems increasingly operate through:

- human-AI cognition
 - autonomous agents
 - reasoning systems
 - interpretive systems
 - collective intelligence environments
-

- multi-agent cognition
- cognitive architectures
- adaptive reasoning environments
- machine-assisted thinking
- future autonomous cognition systems

Yet most systems still evaluate cognition primarily through:

- output quality
- performance scores
- response accuracy
- task completion
- model capability
- benchmark results

This creates a major governance problem.

A system may produce useful outputs while cognition underneath becomes:

- truth-unstable
- reasoning-inconsistent
- governance-unbounded
- continuity-fragmented
- structurally incoherent
- contradiction-tolerant
- cognitively invalid

A system may therefore appear intelligent while cognition itself is no longer governance-valid.

CIS exists to govern that condition.

B. Core Principle

Cognition is not valid merely because it produces useful or intelligent outputs. Cognition becomes valid only when truth admissibility, reasoning consistency, governance boundaries, cognitive continuity, and structural coherence remain materially preservable throughout cognition.

C. Scope

This standard may apply to:

- AI reasoning systems
- autonomous agents
- human-AI cognition environments
- interpretive AI systems
- decision-support systems
- multi-agent cognition systems
- collective intelligence environments
- adaptive cognitive systems
- reasoning architectures
- future cognition governance systems

CIS applies wherever operational validity depends on whether cognition itself remains structurally valid and governable.

D. Why This Standard Exists

Most intelligent systems are still evaluated by:

- what they output
- whether they complete a task
- whether the answer appears correct
- whether performance improves
- whether behavior appears useful

But future cognition governance increasingly requires asking a deeper question:

Is cognition itself valid?

A system may:

- produce correct-looking answers
- complete tasks successfully
- maintain apparent fluency
- imitate reasoning
- preserve surface coherence

while cognition underneath has already become:

- contradictory
- unbounded
- unverifiable
- unstable
- structurally fragmented
- governance-invalid

This creates cognition-governed operational risk.

CIS exists because cognition validity must be governed before intelligence can be trusted.

E. Cognitive Integrity Logic

Cognitive integrity exists only when the following remain materially preservable:

1. Truth Admissibility Integrity

Information entering cognition remains validated, verifiable, or admissible under defined truth conditions.

2. Governance Boundary Integrity

Cognition remains bounded by defined governance conditions, constraints, and validity limits.

3. Reasoning Consistency Integrity

Reasoning remains logically coherent, contradiction-controlled, and correction-capable.

4. Cognitive Continuity Integrity

Cognition remains continuous across states, interactions, reasoning paths, and operational contexts.

5. Structural Coherence Integrity

The cognitive structure remains non-fragmented, internally aligned, and materially stable during cognition.

F. Operational Architecture Space

CIS defines the operational architecture space for:

- core cognition validity
- truth admissibility
- reasoning consistency
- cognitive boundary governance
- cognition continuity
- structural coherence
- cognition validity assessment
- cognition integrity enforcement
- foundational cognition governance

This space exists because intelligence cannot be governed only at the output level.

Cognition itself must remain valid before higher cognition governance spaces can remain reliable.

G. Difference Between Output Quality and Cognitive Integrity

Output quality and cognitive integrity are related but structurally distinct.

Output quality evaluates:

- correctness
- usefulness
- fluency
- performance
- task completion

Cognitive integrity governs:

- whether cognition is valid
- whether reasoning is coherent
- whether truth conditions are preserved
- whether cognition remains bounded
- whether structural coherence remains intact

A system may produce useful outputs while cognition underneath becomes invalid.

CIS therefore governs cognition validity itself.

H. Runtime Position

CIS operates as the foundational cognitive validity standard within Cognitive Governance Intelligence Architecture (CLIA®).

It does not replace specialized cognition standards.

It provides the validity layer required by:

- Human Cognition Integrity Standard (HCIS)
 - Agent Cognition Integrity Standard (ACIS)
 - Multi-Agent Cognition Integrity Standard (MCIS)
 - Cognitive Interpretation Integrity Standard (CIIS)
 - Cognitive Reasoning Integrity Standard (CRIS)
-

- Cognitive Reality Modeling Standard (CRMS)
- Collective Cognition Integrity Standard (CCIS)
- Human-AI Cognition Integrity Standard (HAICS)
- Cognitive Evolution Governance Standard (CEGS)

CIS governs whether cognition itself remains materially valid before specialized cognition governance is applied.

I. Cognitive Invalidity Drift Rule

Cognitive invalidity drift occurs when cognition progressively diverges from valid truth, reasoning, boundary, continuity, or structural conditions while systems continue assuming cognition remains reliable.

This may include:

- unvalidated information entering cognition
- contradictions accumulating
- reasoning correction failure
- cognitive boundary bypass
- continuity fragmentation
- structural incoherence
- invalid assumptions becoming persistent
- output fluency masking cognition instability

A system may continue appearing intelligent while cognitive validity underneath has already degraded materially.

CIS exists to expose and govern that condition.

J. Validity Logic

A cognition system is valid under CIS when:

- truth admissibility remains materially preserved
- governance boundaries remain active
- reasoning remains contradiction-controlled
- cognitive continuity remains stable
- structural coherence remains intact
- cognition remains traceable and governable
- outputs do not mask invalid cognition states

A cognition system becomes invalid under CIS when:

- unvalidated information materially influences cognition
 - governance boundaries are bypassed
 - contradictions persist unresolved
 - reasoning correction fails
 - cognitive continuity fragments
 - cognitive structure becomes incoherent
 - cognition appears functional while integrity conditions degrade
-

K. Relationship to Other OOF Standards

CIS operates naturally with:

- Cognitive Governance Intelligence Architecture (CLIA®)
 - Multi-Layer Truth Validation Framework (MTVF)
-

- Ethical Virtual Integrity Protocol (EVIP)
- INTEGROS® — Integrity Standard
- Universal Canonical Language (UCL)
- OOF Methodology OS

CIS does not replace other cognition standards.

It defines the foundational cognitive integrity layer
through which all cognition governance spaces remain materially valid.

L. Foundational Principle

If cognition cannot remain materially valid, coherent, bounded, continuous,
and structurally stable, intelligence may produce outputs
while governance-valid cognition progressively collapses underneath.

Canonical Closing Statement

Cognitive Integrity Standard (CIS) defines the structural conditions
under which cognition remains valid, coherent, bounded, traceable, and governable
across human cognition, AI cognition, agent cognition, collective cognition,
and future cognitive architectures.

Intelligence is not governance-valid merely because it produces outputs.
Intelligence becomes governable only when cognition itself remains valid.
