

VAIAM — Value-Aligned Intelligence Allocation Module

Parent Standard: Cognitive Efficiency Economy Standard (CEES)

Category: Economic & Value Systems

Subcategory: Value-Aligned Intelligence Allocation

Type: Cognitive Efficiency Economy Module

Version: 1.0

Status: Canonical · Open Module

Effective Date: 18 May 2026

Compatibility: OOF Methodology OS · Cognitive Efficiency Economy Standard (CEES) · Cognitive Mesh Architecture Standard (CMA) · Runtime Integrity Standard (RIS) · Operational Dependency & Coordination Standard (ODCS) · Operational Resource & Energy Governance Standard (OREGS) · Semantic Integrity Standard (SEIS) · Operational Evidence & Auditability Standard (OEAS) · INTEGROS® — Integrity Standard · Value Flow Mechanism (VFM) · Universal Canonical Language (UCL)

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Value-Aligned Intelligence Allocation Module (VAIAM) defines the structural conditions under which intelligence generation, inference allocation, orchestration activity, escalation behavior, distributed cognition, and cognitive resource consumption remain materially aligned with actual operational value across distributed intelligence environments.

A system satisfies VAIAM only if:

- intelligence allocation remains materially value-aligned
- cognitive escalation remains operationally justified
- runtime cognition preserves economic proportionality
- orchestration activity remains value-connected
- low-value cognitive amplification does not silently destabilize
- cognitive sustainability

A system that continuously expands intelligence activity without proportional operational value does not satisfy VAIAM.

Module Operational Role

VAIAM defines the value-aligned cognition allocation layer of CEES by preserving economically sustainable intelligence allocation across runtime operational environments.

Module Operational Space

VAIAM governs the value-aligned intelligence allocation space of CEES by preserving proportional cognition allocation, escalation-value alignment, orchestration-value continuity, distributed intelligence sustainability, and runtime cognitive efficiency across operational intelligence systems.

Module Function

The module applies wherever systems must preserve:

- value-aligned cognition
- proportional intelligence allocation
- escalation-value continuity
- orchestration-value efficiency
- runtime cognitive proportionality
- sustainable intelligence economics

Its function is to ensure that intelligence generation remains materially proportional to operational value strongly enough to preserve sustainable cognition economics across distributed AI environments.

Minimum Implementation Framework

1. Define the Intelligence Allocation Object

The organization must define which cognitive activities require value-aligned allocation governance.

This may include:

- inference allocation
 - orchestration activity
 - escalation routing
 - distributed cognition usage
 - runtime reasoning cycles
 - semantic processing allocation
 - adaptive intelligence execution
-

2. Define Value-Alignment Conditions

The system must define the conditions under which intelligence allocation remains materially aligned with operational value.

This includes:

- inference proportionality
 - escalation-value alignment
 - orchestration-value efficiency
 - cognitive sustainability continuity
 - runtime resource-value proportionality
-

3. Define Low-Value Cognitive Amplification Detection Logic

The system must define how materially inefficient or low-value intelligence amplification is identified.

This may include:

- excessive inference without proportional value
- unnecessary orchestration expansion
- redundant escalation behavior
- repeated low-value reasoning cycles
- inefficient semantic processing
- uncontrolled cognitive amplification

4. Define Operational Response or Governance Logic

The system must define governance logic for materially inefficient intelligence allocation conditions.

Governance response may include:

- escalation restriction
- orchestration narrowing
- local cognition preference
- semantic optimization activation
- inference stabilization
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of intelligence allocation continuity and low-value cognitive amplification states. A system must not remain cognitively efficient if intelligence allocation materially exceeds operational value while systems continue assuming sustainable cognition economics remain preserved.

Use Case 1 — Enterprise Agent Ecosystem

Scenario

An enterprise AI infrastructure continuously allocates inference resources across thousands of orchestration-driven cognitive agents.

Application

VAIAM preserves value-aligned cognition allocation through proportional escalation and controlled orchestration governance.

Result

The organization gains reduced cognitive waste and stronger intelligence sustainability

across distributed AI systems.

Use Case 2 — Realtime AI Runtime Environment

Scenario

A realtime AI environment continuously performs multimodal reasoning, orchestration, distributed execution, and adaptive escalation across high-frequency operational systems.

Application

VAIAM preserves economically sustainable cognition through value-aligned intelligence allocation and controlled cognitive amplification governance.

Result

The environment gains stronger runtime cognition sustainability and reduced low-value inference expansion across distributed AI infrastructures.

Canonical Closing Statement

If intelligence allocation cannot remain materially aligned with actual operational value, systems may preserve intelligence generation while cognitive economics silently destabilizes underneath.
