

ARM — Authority & Responsibility Module

Canonical Definition

Authority & Responsibility defines the structure by which decision power, execution, and accountability are explicitly assigned, identity-bound, and non-transferable without traceability.

No system is governed if responsibility is undefined.

Purpose

This module ensures that:

- every decision has a defined authority
 - every action has an accountable entity
 - responsibility cannot be anonymous or detached
-

Core Principle

Decision without responsibility is system failure.

Minimum Implementation Framework (MIF)

The system MUST define:

1. Decision Authority (DA)

- entity authorized to make decisions

2. Execution Authority (EA)

- entity responsible for execution

3. Responsibility Holder (RH)

- entity legally and operationally accountable
-

Mandatory Conditions

- all roles MUST be assigned
 - roles MUST be identity-bound
 - roles MUST be attributable
 - responsibility MUST not be anonymous
-

Prohibited Conditions

- undefined responsibility
 - shared responsibility without traceability
 - anonymous decision-making
-

- execution without accountable entity
-

Output

The system produces:

Clear Authority Mapping
Explicit Responsibility Assignment

System Condition

- **Valid** → all roles defined and active
 - **Invalid** → any role missing or unassigned
-

Use Case 1 — Corporate Decision

Without module:

- multiple actors decide
- no clear accountability

With module:

- decision authority defined
- responsibility assigned

Result:

- accountability enforced
-

Use Case 2 — AI System Oversight

Without module:

- AI acts without clear responsibility

With module:

- human responsibility holder defined

Result:

- AI actions remain accountable
-

Closing Insight

If no one is responsible, the system is not governed.
