

OOF Compatibility — CGRM Standard

What OOF Compatibility Means

OOF Compatibility is an **operational system state**, not a certificate, document, or label.

It defines whether a system operates under required governance conditions in real operation — not whether it only claims alignment.

Compatibility exists only while conditions are actively satisfied

CGRM Compatibility Defined

A system is **CGRM Compatible** if:

- responsibility is explicitly assigned
- authority is clearly defined
- decisions are traceable
- escalation is controlled
- governance is enforceable

All conditions must operate:

- simultaneously
 - continuously
 - in real time
-

Three Layers of Adoption

1. Self-Declaration

Self-declaration is the **entry layer**.

It allows any organization to:

- declare alignment
- accept responsibility
- make governance claims publicly

Organizations may state:

OOF Aligned (CGRM)

What It Means:

- governance conditions are implemented
- responsibility is accepted
- claims are publicly attributable

Self-declaration creates accountability.

2. Minimal Implementation Framework

The implementation framework defines:

how CGRM is applied in practice

It provides:

- minimum required steps
- clear implementation structure
- immediate usability

What It Does:

- turns governance into operation
- enables real system control
- ensures conditions are active

Implementation makes governance real.

3. Validation (Optional)

Validation is an **additional layer** , not a requirement.

It may include:

- independent verification
- system audit
- confirmation of conditions

What It Means:

- the system has been externally reviewed
- conditions are confirmed at a given time

Validation confirms reality. It does not create it.

System Logic

- declaration creates responsibility
 - implementation creates operation
 - validation confirms state
-

System States

A system may be:

- **OOF Aligned** → declared and accountable
- **CGRM Compatible** → conditions active
- **OOF Validated** → externally verified

There is no permanent state.

Important Distinction

- alignment = responsibility
 - compatibility = real operation
 - validation = external confirmation
-

Structural Rule

Compatibility exists only while conditions are satisfied.

Why This Model Works

Traditional systems rely on:

- certification
- delayed verification
- external approval

OOF model relies on:

- continuous responsibility
 - real-time operation
 - observable governance
-

Core Principle

You do not gain trust by being verified.

You gain trust by being accountable.

Closing Statement

Compatibility is not granted.

It is maintained.
