

# CLA™ Architecture Map

## Classification Architecture — Classification Governance Layer

Official Classification Governance Reference Map for AI Systems, Autonomous

Systems, Digital Assets, Organizations, Critical Infrastructure, Regulatory

Frameworks, and Future Operational Environments

**CLA™ serves as the official OOF® classification governance reference map used to identify, define, classify, navigate, validate, and understand governable classification spaces across AI systems, autonomous systems, digital assets, organizations, critical infrastructure, regulatory frameworks, and future operational environments.**

**The purpose of CLA™ is not to define individual classifications or prescribe domain-specific classification content.**

**The purpose of CLA™ is to identify, define, separate, and map the governable spaces through which classifications are established, evaluated, validated, governed, managed, exchanged, transformed into operational intelligence, and continuously assured.**

**CLA™ serves as the official classification governance reference map for:**

- AI Systems
- Autonomous Systems
- Autonomous Agents
- Digital Assets
- Digital Identity Environments
- Enterprise Systems
- Government Systems
- Healthcare Infrastructure
- Financial Infrastructure
- Industrial Systems
- Critical Infrastructure
- Regulatory Frameworks
- Multi-System Environments
- Future Operational Ecosystems

---

## Core Architectural Principle

Every classification governance space answers one primary governance question.

No classification governance space duplicates the purpose of another

classification governance space.

Every classification governance space has a defined beginning, a defined operational purpose, and a defined governance boundary.

Every classification governance space begins where the preceding classification governance requirement has been sufficiently established.

Together, these classification governance spaces form the official classification governance reference map of CLA™.

---

## Official Classification Governance Flow

**Classification Foundation → Classification Criteria → Classification Decision → Classification Integrity → Classification Validation → Classification Lifecycle → Classification Registry → Classification Interoperability → Classification Intelligence → Classification Assurance**

---

### 1. Classification Foundation Standard (CFS)

**Governed Space:** Classification Foundation

#### Core Question

**How can classifications be formally established as governed operational structures?**

#### Canonical Definition

**Classification Foundation Standard (CFS)** defines the governance conditions under which classifications are formally established, identified, scoped, contextualized, documented, and recognized as governed operational structures suitable for consistent governance.

#### Governance Boundary

Begins when a classification must be formally established for operational governance.

Ends when the classification has been sufficiently defined, scoped, contextualized, structured, and documented to support governed classification criteria.

---

### 2. Classification Criteria Standard (CCS)

**Governed Space:** Classification Criteria

#### Core Question

**Which governed criteria determine how classifications are consistently created and evaluated?**

## **Canonical Definition**

**Classification Criteria Standard (CCS)** defines the governance conditions under which objective classification criteria, evaluation rules, scoring principles, and assessment requirements are established and governed to ensure consistent classification outcomes.

## **Governance Boundary**

Begins when a formally established classification requires objective evaluation criteria.

Ends when approved classification criteria have been defined, validated, documented, and made available for governed classification decisions.

---

## **3. Classification Decision Standard (CDS)**

**Governed Space:** Classification Decision

### **Core Question**

**How should classification decisions be objectively performed, justified, and governed?**

## **Canonical Definition**

**Classification Decision Standard (CDS)** defines the governance conditions under which classification decisions are objectively performed, justified, verified, approved, documented, and made operationally accountable.

## **Governance Boundary**

Begins when approved classification criteria are available for operational decision-making.

Ends when the classification decision has been objectively justified, verified, approved, and formally documented.

---

## **4. Classification Integrity Standard (CIS)**

**Governed Space:** Classification Integrity

### **Core Question**

**How can classification integrity remain consistent, reliable, and governance-compliant?**

---

## Canonical Definition

**Classification Integrity Standard (CIS)** defines the governance conditions under which classifications preserve consistency, reliability, structural coherence, methodological integrity, and governance compliance throughout their operational use.

## Governance Boundary

Begins when an approved classification decision requires protection of its integrity.

Ends when classification integrity has been continuously established, monitored, validated, and prepared for independent classification validation.

---

## 5. Classification Validation Standard (CVS)

**Governed Space:** Classification Validation

### Core Question

**How can classifications be independently validated before operational use?**

## Canonical Definition

**Classification Validation Standard (CVS)** defines the governance conditions under which classifications are independently verified, evaluated, reviewed, approved, evidenced, and documented before being accepted for operational use.

## Governance Boundary

Begins when classification integrity has been established and independent validation becomes necessary.

Ends when the classification has been objectively validated, approved, documented, and authorized to enter operational lifecycle governance.

---

## 6. Classification Lifecycle Standard (CLS)

**Governed Space:** Classification Lifecycle

### Core Question

**How should classifications be governed throughout their complete operational lifecycle?**

## Canonical Definition

**Classification Lifecycle Standard (CLS)** defines the governance conditions under which classifications are planned, deployed, monitored, reviewed, maintained, updated, retired, and governed throughout their complete operational lifecycle.

### **Governance Boundary**

Begins when a validated classification becomes operational.

Ends when the classification lifecycle has been completely governed or the classification transitions into centralized registry governance.

---

## **7. Classification Registry Standard (CRS)**

**Governed Space:** Classification Registry

### **Core Question**

**How can classifications be centrally registered, uniquely identified, and continuously governed?**

### **Canonical Definition**

**Classification Registry Standard (CRS)** defines the governance conditions under which classifications are registered, uniquely identified, organized, maintained, discovered, and governed within an authoritative classification registry.

### **Governance Boundary**

Begins when an operational classification requires official registration within an authoritative registry.

Ends when the classification has been uniquely identified, registered, organized, maintained, and made available for governed interoperability.

---

## **8. Classification Interoperability Standard (CIS)**

**Governed Space:** Classification Interoperability

### **Core Question**

**How can classifications remain interoperable across systems, organizations, and governance environments?**

### **Canonical Definition**

**Classification Interoperability Standard (CIS)** defines the governance conditions under which classifications remain compatible, consistently interpreted, mapped, translated, synchronized, validated, and operationally interoperable across heterogeneous

---

environments.

## **Governance Boundary**

Begins when registered classifications require exchange or operational use across multiple systems, organizations, or governance environments.

Ends when classifications have been successfully exchanged, interpreted, synchronized, validated, and made available for intelligence generation.

---

## **9. Classification Intelligence Standard (CIS)**

**Governed Space:** Classification Intelligence

### **Core Question**

**How can governed classifications generate trustworthy operational intelligence for analysis and decision-making?**

### **Canonical Definition**

**Classification Intelligence Standard (CIS)** defines the governance conditions under which classifications are transformed into trustworthy operational intelligence through analytical interpretation, reasoning, decision support, intelligence validation, and operational insight generation.

## **Governance Boundary**

Begins when interoperable classifications are available for operational analysis or decision support.

Ends when classification-derived intelligence has been generated, validated, documented, and prepared for independent assurance.

---

## **10. Classification Assurance Standard (CAS)**

**Governed Space:** Classification Assurance

### **Core Question**

**How can the complete classification lifecycle remain continuously trustworthy, governed, and independently assured?**

### **Canonical Definition**

**Classification Assurance Standard (CAS)** defines the governance conditions under which the complete classification lifecycle is independently evaluated, validated, monitored, reviewed, and continuously assured to maintain long-term governance trustworthiness.

---

## Governance Boundary

Begins when classifications have been operationally established or restored and require continuous independent assurance.

Continues throughout the remaining operational lifecycle while classifications must remain objectively trustworthy, operationally reliable, governance-compliant, and independently verifiable.

---

## Core Governed Classification Spaces

- Classification Foundation
  - Classification Criteria
  - Classification Decision
  - Classification Integrity
  - Classification Validation
  - Classification Lifecycle
  - Classification Registry
  - Classification Interoperability
  - Classification Intelligence
  - Classification Assurance
- 

## Architectural Position

**CLA™ governs the complete classification governance lifecycle.**

The architecture progresses through:

**Classification Foundation → Classification Criteria → Classification Decision → Classification Integrity → Classification Validation → Classification Lifecycle → Classification Registry → Classification Interoperability → Classification Intelligence → Classification Assurance**

Together, these classification governance spaces govern how classifications are formally established, objectively evaluated, consistently decided, structurally protected, independently validated, operationally managed throughout their lifecycle, authoritatively registered, interoperably exchanged, transformed into trustworthy operational intelligence, and continuously assured across AI systems, autonomous systems, organizations, digital assets, critical infrastructure, regulatory frameworks, and future operational environments.

---

## What CLA™ Defines

**CLA™ defines:**

- where classification governance begins,
  - how classifications are formally established,
-

- which governed criteria determine classification outcomes,
- how classification decisions are objectively performed,
- how classification integrity is preserved,
- how classifications are independently validated,
- how classifications are governed throughout their operational lifecycle,
- how classifications are officially registered and managed,
- how classifications remain interoperable across heterogeneous environments,
- how classifications generate trustworthy operational intelligence,
- how the complete classification lifecycle is continuously assured.

**CLA™ provides the official classification governance language used for classification-space identification, lifecycle navigation, governance classification, structural diagnosis, interoperability design, intelligence generation, and classification architecture development across complex operational environments.**

---

## **Compatible OOF® Architectures**

- **GOA™ — Governance Architecture**
  - **ORA™ — Operational Reality Architecture**
  - **OBIDENTITY® — Origin-Bound Identity Governance Architecture**
  - **AGA™ — Accountability Governance Architecture**
  - **AIG® — AI Governance Architecture**
  - **CLIA® — Cognitive Governance Intelligence Architecture**
  - **MGIA™ — Memory Governance Intelligence Architecture**
  - **ASGA™ — Autonomous Systems Governance Architecture**
  - **INTEGROS® — Integrity Governance Architecture**
  - **ART™ — Audit in Real Time Architecture**
- 

## **Canonical Principle**

**CLA™ does not define what should be classified or which classifications are correct. CLA™ governs the structural conditions under which classifications remain formally established, methodologically consistent, operationally valid, interoperable, intelligently applicable, and continuously assured throughout their complete operational lifecycle.**

---

## **Canonical Closing Statement**

**CLA™ serves as the official classification governance reference map for AI systems, autonomous systems, digital assets, organizations, critical infrastructure, regulatory frameworks, and future operational environments. By defining the primary governable spaces of classification, CLA™ provides the architecture used to establish,**

---

evaluate, validate, govern, register, exchange, interpret, assure,  
and continuously improve classifications throughout the complete  
operational lifecycle.
