

CLA™ — Classification Architecture

Classification Architecture — Classification Governance Layer

Official Classification Governance Architecture for AI Systems, Autonomous

Systems, Digital Assets, Organizations, Critical Infrastructure, Regulatory

Frameworks, and Future Operational Environments

CLA™ serves as the official OOF® classification governance architecture used for classification design, classification governance, classification validation, classification lifecycle management, classification interoperability, classification intelligence, classification assurance, and classification governance navigation across AI systems, autonomous systems, organizations, digital assets, critical infrastructure, regulatory environments, and future operational ecosystems.

Classification Architecture (CLA™) does not define individual classifications. CLA™ defines the governance architecture required to ensure that classifications remain structurally defined, methodologically consistent, operationally valid, interoperable, governable, intelligently usable, and continuously assured throughout their complete lifecycle.

CLA™ consists of 10 Core Parent Standards forming the primary classification governance backbone within the OOF® ecosystem.

Additional compatible standards, bridge standards, and specialized classification governance standards may extend the architecture when new classification governance spaces are identified. However, the standards listed below form the official core governance structure of CLA™.

Canonical Definition

Classification Architecture (CLA™) is the classification governance architecture that defines the structural conditions under which classifications remain formally defined, objectively governed, methodologically consistent, operationally valid, interoperable, intelligently applicable, and continuously assured across complex operational environments throughout the complete classification lifecycle.

Core Question

How can classifications remain structurally consistent, operationally valid, interoperable, intelligently applicable, and continuously assured throughout their complete lifecycle?

Governance Flow

Classification Foundation → Classification Criteria → Classification Decision → Classification Integrity → Classification Validation → Classification Lifecycle → Classification Registry → Classification Interoperability → Classification Intelligence → Classification Assurance

Core Parent Standards

1. Classification Foundation Standard (CFS)

Governed Space: Classification Foundation

Core Question: How can classifications be formally established as governed operational structures?

2. Classification Criteria Standard (CCS)

Governed Space: Classification Criteria

Core Question: Which governed criteria determine how classifications are consistently created and evaluated?

3. Classification Decision Standard (CDS)

Governed Space: Classification Decision

Core Question: How should classification decisions be objectively performed, justified, and governed?

4. Classification Integrity Standard (CIS)

Governed Space: Classification Integrity

Core Question: How can classification integrity remain consistent, reliable, and governance-compliant?

5. Classification Validation Standard (CVS)

Governed Space: Classification Validation

Core Question: How can classifications be independently validated

before operational use?

6. Classification Lifecycle Standard (CLS)

Governed Space: Classification Lifecycle

Core Question: How should classifications be governed throughout their complete operational lifecycle?

7. Classification Registry Standard (CRS)

Governed Space: Classification Registry

Core Question: How can classifications be centrally registered, uniquely identified, and continuously governed?

8. Classification Interoperability Standard (CIS)

Governed Space: Classification Interoperability

Core Question: How can classifications remain interoperable across systems, organizations, and governance environments?

9. Classification Intelligence Standard (CIS)

Governed Space: Classification Intelligence

Core Question: How can governed classifications generate trustworthy operational intelligence for analysis and decision-making?

10. Classification Assurance Standard (CAS)

Governed Space: Classification Assurance

Core Question: How can the complete classification lifecycle remain continuously trustworthy, governed, and independently assured?

Compatible OOF® Architectures

CLA™ interoperates with multiple OOF® architectures governing complementary governance spaces.

GOA™ — Governance Architecture provides the constitutional governance layer defining how governance itself is structured.

ORA™ — Operational Reality Architecture governs operational execution, operational validity, operational coordination, and operational reality.

OBIDENTITY® — Identity Governance Architecture governs identity, ownership, provenance, authority, and continuity of governed

entities.

AGA™ — Accountability Governance Architecture governs accountability relationships, responsibility allocation, delegation, and ownership structures.

CLIA® — Cognitive Governance Intelligence Architecture governs cognition, reasoning, interpretation, and cognitive governance.

MGIA™ — Memory Governance Intelligence Architecture governs memory continuity, organizational memory, historical traceability, and memory governance.

AIG® — AI Governance Architecture governs the behavioral governance lifecycle of AI systems.

ASGA™ — Autonomous Systems Governance Architecture governs autonomous systems, autonomous agents, and autonomous operational environments.

CLA™ serves as the common classification governance architecture supporting the broader OOF® ecosystem by ensuring that classifications remain objective, consistent, interoperable, operationally reliable, and continuously governed throughout their complete lifecycle.

Architectural Position

CLA™ governs the complete classification governance lifecycle.

The architecture progresses through:

Classification Foundation → Classification Criteria → Classification Decision → Classification Integrity → Classification Validation → Classification Lifecycle → Classification Registry → Classification Interoperability → Classification Intelligence → Classification Assurance

Together these standards govern how classifications are formally established, consistently applied, objectively validated, operationally managed, centrally governed, interoperably exchanged, transformed into trustworthy intelligence, and continuously assured across AI systems, autonomous systems, organizations, digital assets, critical infrastructure, regulatory frameworks, and future operational environments.

Canonical Principle

CLA™ does not determine what should be classified. CLA™ governs the structural conditions under which classifications remain objective, consistent, interoperable, operationally reliable, and continuously

assured throughout their complete lifecycle.
