

Classification Assignment Standard (CAS)

OriginID: OOF-OID-CLA-CAS-2026-08-04-0004
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: CLA® — Classification Architecture
Operational Layer: Classification Assignment Governance Layer
Category: AI & Interpretation
Subcategory: Classification Governance
Type: Parent Standard
Governed Space: Classification Assignment
Version: 1.0
Status: Canonical · Open Standard
Origin Date: 4 August 2026
Compatibility: OOF Methodology OS · GOA™ · OBIDENITY® · INTEGROS® ·
ORA™ · AGA™ · AIG® · CLIA® ·
MGIA™ · ASGA™ · ADIT® · RIS™
AI-Readable: Yes
Authority: OOF®
Protection: MIP™ — Methodological Intellectual Property
Canonical Language: English (UCL)

Governed Space

Classification Assignment

Core Question

How can a classification be assigned correctly, consistently, transparently, and independently verifiably after its scope, criteria, and context have been established?

Canonical Definition

Classification Assignment Standard defines the governance conditions required to assign classifications using approved scope, established criteria, and validated context. It establishes assignment methodology, governance controls, decision mechanisms, assignment validation principles, and lifecycle governance necessary to ensure that every assigned classification is accurate, justified, reproducible, explainable, and independently verifiable.

Governance Flow Position

Classification Scope → Classification Criteria → Classification
Context → Classification Assignment → Classification Validation →

Standard Abstract

Defining what may be classified, establishing classification criteria, and validating context do not perform the classification itself.

A governed assignment process is required to consistently transform evaluated information into an official classification decision that can be explained, reproduced, audited, and trusted.

Classification Assignment Standard establishes the fourth governance layer of CLA®, ensuring that every classification is assigned through a controlled, transparent, and methodologically consistent governance process.

Operational Role

Classification Assignment Standard governs the assignment layer of classification governance by establishing standardized methods for assigning, documenting, reviewing, validating, and governing classification decisions throughout their complete lifecycle.

Operational Space

Classification Assignment Standard governs:

- classification assignment,
 - assignment methodology,
 - assignment consistency,
 - assignment decisions,
 - assignment governance,
 - assignment documentation,
 - assignment validation.
-

Why This Standard Exists

A classification becomes operational only after an official assignment has been performed.

Without governed assignment, classification decisions may become inconsistent, subjective, undocumented, difficult to reproduce, or impossible to independently verify.

Classification Assignment Standard exists because **Classification Assignment** represents the **fourth governed space** of CLA® — **Classification Architecture**, transforming governed evaluation into

governed classification decisions.

Scope

This standard may be applied across:

- AI systems,
 - autonomous systems,
 - cybersecurity,
 - digital identities,
 - healthcare,
 - financial services,
 - industrial operations,
 - regulatory compliance,
 - critical infrastructure,
 - public administration,
 - operational governance,
 - and any environment requiring governed classification decisions.
-

Relationship to Other OOF® Architectures

Classification Assignment Standard interoperates with:

- **GOA™**
- **OBIDENTITY®**
- **INTEGROS®**
- **ORA™**
- **AGA™**
- **AIG®**
- **CLIA®**
- **MGIA™**
- **ASGA™**
- **ADIT®**
- **RIS™**

by providing the canonical methodology for assigning governed classifications consistently, transparently, and independently across all operational domains.

Foundational Principle

A classification becomes trustworthy only when its assignment is governed.

Canonical Closing Statement

Classification Assignment Standard establishes the canonical governance framework for assigning classifications throughout the complete classification lifecycle. By governing assignment methodology, assignment decisions, governance controls, assignment validation, and continuous assignment governance, the standard enables accurate classification, operational consistency, accountable governance, and independent verification across all operational domains.
