

Classification Completeness Module (CCM)

Architecture Ecosystem: Structured Reality Standards™
Architecture Family: CLA™ — Classification Architecture
Parent Standard: Classification Assurance Standard (CAS)
Operational Layer: Classification Assurance Governance Layer
Category: Governance & Classification
Subcategory: Classification Governance
Type: Parent Standard Module
Governed Space: Classification Completeness
Version: 1.0
Status: Canonical · Open Module
Origin Date: 6 August 2026
Compatibility: OOF Methodology OS · GOA™ · OBIDENTITY® · INTEGROS® ·
ORA™ · AGA™ · AIG® · CLIA® ·
MGIA™ · ASGA™ · RIS™
AI-Readable: Yes
Authority: OOF®
Protection: MIP® — Methodological Intellectual Property
Canonical Language: English (UCL)

Governed Space

Classification Completeness

Canonical Definition

Classification Completeness Module defines the governance framework for evaluating whether the complete classification lifecycle has fully satisfied its declared scope, governance objectives, methodological requirements, interoperability obligations, intelligence requirements, and documentation responsibilities. It establishes completeness methodology, governance controls, validation criteria, review mechanisms, and continuous completeness assurance necessary to ensure that no material classification activities, governance processes, or operational records have been omitted.

Operational Role

Classification Completeness Module governs the completeness layer of classification assurance by confirming that every required component of the classification lifecycle has been performed, documented, validated, preserved, and remains available for independent verification.

Minimum Implementation Framework

1. Define Completeness Requirements

Establish lifecycle scope, governance objectives, required activities, documentation obligations, interoperability requirements, intelligence requirements, responsible authorities, and completion criteria.

2. Define Completeness Methodology

Develop standardized procedures for reviewing lifecycle coverage, confirming completion of required governance activities, identifying omissions, documenting completeness assessments, and maintaining assurance consistency.

3. Define Completeness Validation Logic

Verify that classification creation, validation, lifecycle management, registry governance, interoperability, intelligence generation, assurance activities, and supporting documentation completely satisfy established governance requirements.

4. Define Governance Response

Establish procedures for incomplete governance activities, missing documentation, uncovered lifecycle scope, governance deficiencies, reassessment requirements, corrective actions, and continuous completeness improvement.

5. Preserve Completeness Records

Maintain completeness assessments, validation reports, governance approvals, identified gaps, corrective actions, timestamps, responsible authorities, and complete audit trails throughout the classification assurance lifecycle.

Use Case 1 — Autonomous AI Governance

Scenario

An organization performs an assurance review after implementing a classification governance framework for autonomous AI systems.

Application

Classification Completeness Module governs evaluation of lifecycle coverage by confirming that every required governance activity, validation step, interoperability requirement, intelligence function, and assurance process has been completed.

Result

The organization demonstrates that the complete classification lifecycle is fully governed, documented, and suitable for

Use Case 2 — Regulatory Classification Oversight

Scenario

A regulatory authority reviews whether an official classification framework completely satisfies national governance and regulatory requirements.

Application

Classification Completeness Module governs assessment of governance scope, lifecycle coverage, operational documentation, interoperability obligations, and methodological completeness before assurance is granted.

Result

The classification framework is confirmed to be complete, governance-compliant, operationally reliable, and independently verifiable.

Canonical Closing Statement

Classification Completeness Module establishes the canonical governance framework for verifying the completeness of the classification lifecycle. By governing completeness methodology, lifecycle coverage, governance controls, review procedures, and continuous completeness assurance, the module enables trustworthy classifications, accountable governance, operational confidence, and independent verification across all operational domains.
