

Classification Quality Module (CQM)

Architecture Ecosystem: Structured Reality Standards™
Architecture Family: CLA™ — Classification Architecture
Parent Standard: Classification Assurance Standard (CAS)
Operational Layer: Classification Assurance Governance Layer
Category: Governance & Classification
Subcategory: Classification Governance
Type: Parent Standard Module
Governed Space: Classification Quality
Version: 1.0
Status: Canonical · Open Module
Origin Date: 6 August 2026
Compatibility: OOF Methodology OS · GOA™ · OBIDENITY® · INTEGROS® ·
ORA™ · AGA™ · AIG® · CLIA® ·
MGIA™ · ASGA™ · RIS™
AI-Readable: Yes
Authority: OOF®
Protection: MIP® — Methodological Intellectual Property
Canonical Language: English (UCL)

Governed Space

Classification Quality

Canonical Definition

Classification Quality Module defines the governance framework for evaluating, maintaining, and continuously improving the quality of the complete classification lifecycle. It establishes quality methodology, governance controls, quality evaluation criteria, continuous improvement mechanisms, and ongoing quality assurance necessary to ensure that classifications consistently satisfy methodological excellence, operational reliability, governance integrity, and independent verifiability.

Operational Role

Classification Quality Module governs the quality layer of classification assurance by continuously evaluating whether classification design, validation, lifecycle management, registry governance, interoperability, intelligence generation, and assurance activities satisfy established governance and methodological standards.

Minimum Implementation Framework

1. Define Quality Requirements

Establish quality objectives, governance expectations, evaluation criteria, performance metrics, responsible authorities, and acceptance thresholds.

2. Define Quality Methodology

Develop standardized procedures for measuring classification quality, evaluating governance performance, identifying improvement opportunities, documenting quality assessments, and maintaining continuous quality governance.

3. Define Quality Validation Logic

Verify that classifications satisfy established quality standards, governance requirements, methodological consistency, operational reliability, interoperability expectations, and intelligence quality requirements.

4. Define Governance Response

Establish procedures for quality deficiencies, governance exceptions, improvement recommendations, corrective actions, reassessment requirements, and continuous quality enhancement.

5. Preserve Quality Records

Maintain quality assessments, governance approvals, validation reports, improvement actions, quality metrics, timestamps, responsible authorities, and complete audit trails throughout the classification assurance lifecycle.

Use Case 1 — Autonomous AI Governance

Scenario

An organization performs a periodic quality assessment of the classification framework used by autonomous AI systems.

Application

Classification Quality Module governs evaluation of classification methodology, governance quality, lifecycle consistency, interoperability quality, intelligence generation, and assurance performance.

Result

The organization continuously improves classification quality while maintaining operational trustworthiness, governance consistency, and independent verifiability.

Use Case 2 — Regulatory Classification Oversight

Scenario

A regulatory authority evaluates the quality of classification frameworks used across regulated organizations.

Application

Classification Quality Module governs independent assessment of classification methodology, governance maturity, operational consistency, assurance quality, and continuous improvement.

Result

Classification quality becomes measurable, transparent, continuously improved, and independently verifiable across regulated environments.

Canonical Closing Statement

Classification Quality Module establishes the canonical governance framework for continuously evaluating and improving classification quality. By governing quality methodology, governance controls, evaluation criteria, continuous improvement, and ongoing quality assurance, the module enables trustworthy classifications, operational excellence, accountable governance, and independent verification across all operational domains.
