

Classification Assurance Standard (CAS)

OriginID: OOF-OID-CLA-CAS-2026-08-06-0010
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: CLA™ — Classification Architecture
Operational Layer: Classification Assurance Governance Layer
Category: Governance & Classification
Subcategory: Classification Governance
Type: Parent Standard
Governed Space: Classification Assurance
Version: 1.0
Status: Canonical · Open Standard
Origin Date: 6 August 2026
Compatibility: OOF Methodology OS · GOA™ · OBIDENTITY® · INTEGROS® ·
ORA™ · AGA™ · AIG® · CLIA® ·
MGIA™ · ASGA™ · RIS™
AI-Readable: Yes
Authority: OOF®
Protection: MIP® — Methodological Intellectual Property
Canonical Language: English (UCL)

Governed Space

Classification Assurance

Core Question

How can the complete classification lifecycle remain continuously trustworthy, objective, complete, governed, and independently verifiable throughout its operational existence?

Canonical Definition

Classification Assurance Standard defines the governance conditions required to independently evaluate, validate, monitor, and continuously assure the quality, integrity, completeness, interoperability, intelligence, and methodological validity of the complete classification lifecycle. It establishes assurance methodology, governance controls, assurance validation, independence principles, continuous monitoring, and assurance governance necessary to ensure that classifications remain objectively trustworthy, operationally reliable, reproducible, and independently verifiable throughout their complete lifecycle.

Governance Flow Position

Classification Foundation → Classification Criteria → Classification Decision → Classification Integrity → Classification Validation → Classification Lifecycle → Classification Registry → Classification Interoperability → Classification Intelligence → Classification Assurance

Standard Abstract

Completing a classification lifecycle does not automatically guarantee that classifications remain trustworthy over time.

The complete governance process—including classification creation, validation, lifecycle management, registry governance, interoperability, and intelligence generation—must itself become subject to independent assurance.

Classification Assurance Standard establishes the final governance layer of **CLA™ — Classification Architecture**, ensuring that the complete classification ecosystem remains continuously trustworthy, governed, and independently verifiable.

Operational Role

Classification Assurance Standard governs the assurance layer of classification governance by establishing standardized methods for independently evaluating the quality, integrity, completeness, interoperability, intelligence, governance consistency, and methodological validity of the complete classification lifecycle.

Operational Space

Classification Assurance Standard governs:

- classification assurance,
 - classification quality,
 - classification completeness,
 - assurance validation,
 - assurance review,
 - continuous assurance,
 - assurance governance.
-

Why This Standard Exists

Organizations, regulators, AI systems, and stakeholders require confidence not only in individual classifications but also in the governance system that created, validated, maintained, and applied them.

Without independent assurance, classification governance may appear complete while containing methodological weaknesses, governance

inconsistencies, interoperability failures, or declining operational reliability.

Classification Assurance Standard exists because **Classification Assurance** represents the **tenth and final governed space** of **CLA™** — **Classification Architecture**, completing the classification governance lifecycle.

Scope

This standard may be applied across:

- AI systems,
 - autonomous systems,
 - cybersecurity,
 - digital forensics,
 - financial services,
 - healthcare,
 - industrial operations,
 - regulatory compliance,
 - critical infrastructure,
 - digital identities,
 - operational governance,
 - and any governed environment requiring independent classification assurance.
-

Relationship to Other OOF Architectures

Classification Assurance Standard interoperates with:

- **GOA™**
- **OBIDENTITY®**
- **INTEGROS®**
- **ORA™**
- **AGA™**
- **AIG®**
- **CLIA®**
- **MGIA™**
- **ASGA™**
- **RIS™**

by providing the canonical methodology for independently assuring the quality, integrity, trustworthiness, and methodological validity of the complete classification lifecycle.

Foundational Principle

A trustworthy classification requires trustworthy assurance.

Canonical Closing Statement

Classification Assurance Standard establishes the canonical governance framework for independently assuring the complete classification lifecycle. By governing assurance methodology, quality, completeness, interoperability, intelligence, validation, and continuous assurance, the standard enables trustworthy classifications, operational confidence, accountable governance, and independent verification across all operational domains.
