

Context Governance Module (CGM)

Architecture Ecosystem: Structured Reality Standards™
Architecture Family: CLA® — Classification Architecture
Parent Standard: Classification Context Standard (CCXS)
Operational Layer: Classification Context Governance Layer
Category: AI & Interpretation
Subcategory: Classification Governance
Type: Parent Standard Module
Governed Space: Context Governance
Version: 1.0
Status: Canonical · Open Module
Origin Date: 3 August 2026
Compatibility: OOF Methodology OS · GOA™ · OBIDENITY® · INTEGROS® ·
ORA™ · AGA™ · AIG® · CLIA® ·
MGIA™ · ASGA™ · ADIT® · RIS™
AI-Readable: Yes
Authority: OOF®
Protection: MIP™ — Methodological Intellectual Property
Canonical Language: English (UCL)

Governed Space

Context Governance

Canonical Definition

Context Governance Module defines the governance framework for establishing, managing, monitoring, and continuously improving the governance of contextual information used throughout the classification lifecycle. It establishes governance methodology, governance controls, accountability mechanisms, oversight procedures, and continuous governance principles necessary to ensure that contextual information remains controlled, transparent, consistent, explainable, and independently verifiable.

Operational Role

Context Governance Module governs the governance layer of classification context by establishing authority, accountability, oversight, change control, and continuous governance for contextual information influencing classification decisions.

Minimum Implementation Framework

1. Define Governance Requirements

Establish governance objectives, contextual governance policies, responsible authorities, accountability structures, governance responsibilities, and acceptance criteria.

2. Define Governance Methodology

Develop standardized procedures for governing contextual information, assigning responsibilities, monitoring governance performance, managing contextual changes, and documenting governance activities.

3. Define Governance Validation Logic

Verify that contextual governance remains effective, governance-compliant, consistently applied, methodologically sound, and capable of independent verification throughout the classification lifecycle.

4. Define Governance Response

Establish procedures for governance violations, contextual disputes, accountability failures, governance exceptions, corrective actions, escalation mechanisms, and continuous governance improvement.

5. Preserve Governance Records

Maintain governance policies, contextual governance decisions, accountability records, validation reports, approvals, revision history, timestamps, and complete governance audit trails throughout the classification lifecycle.

Use Case 1 — Autonomous AI Governance

Scenario

An organization establishes governance responsibilities for contextual information used by autonomous AI systems performing operational classifications.

Application

Context Governance Module governs contextual ownership, governance oversight, accountability, policy enforcement, and continuous monitoring of contextual information.

Result

Contextual governance remains transparent, accountable, consistently managed, and independently verifiable across the AI governance lifecycle.

Use Case 2 — National Regulatory Classification Framework

Scenario

A government authority governs contextual rules used for classifying regulated information across multiple public institutions.

Application

Context Governance Module governs policy ownership, contextual oversight, governance responsibilities, review mechanisms, and long-term governance maintenance.

Result

Contextual governance remains standardized, accountable, operationally reliable, and consistently applied across all participating organizations.

Canonical Closing Statement

Context Governance Module establishes the canonical governance framework for governing contextual information throughout the complete classification lifecycle. By governing governance methodology, accountability, oversight, governance controls, validation procedures, and continuous contextual governance, the module enables trustworthy classification, operational reliability, accountable governance, and independent verification across all operational domains.
