

Context Identification Module (CIM)

Architecture Ecosystem: Structured Reality Standards™
Architecture Family: CLA® — Classification Architecture
Parent Standard: Classification Context Standard (CCXS)
Operational Layer: Classification Context Governance Layer
Category: AI & Interpretation
Subcategory: Classification Governance
Type: Parent Standard Module
Governed Space: Context Identification
Version: 1.0
Status: Canonical · Open Module
Origin Date: 3 August 2026
Compatibility: OOF Methodology OS · GOA™ · OBIDENTITY® · INTEGROS® ·
ORA™ · AGA™ · AIG® · CLIA® ·
MGIA™ · ASGA™ · ADIT® · RIS™
AI-Readable: Yes
Authority: OOF®
Protection: MIP™ — Methodological Intellectual Property
Canonical Language: English (UCL)

Governed Space

Context Identification

Canonical Definition

Context Identification Module defines the governance framework for identifying, documenting, and maintaining all contextual factors required before a classification decision is performed. It establishes identification methodology, governance controls, contextual discovery procedures, validation mechanisms, and continuous identification governance necessary to ensure that classification decisions are based on complete, relevant, and independently verifiable contextual information.

Operational Role

Context Identification Module governs the identification layer of classification context governance by ensuring that all relevant contextual factors are systematically identified before classification begins.

Minimum Implementation Framework

1. Define Identification Requirements

Establish contextual objectives, required contextual attributes, governance requirements, responsible authorities, and identification acceptance criteria.

2. Define Identification Methodology

Develop standardized procedures for discovering, documenting, categorizing, and maintaining contextual information affecting classification decisions.

3. Define Identification Validation Logic

Verify that all required contextual information has been identified, documented, remains relevant, and satisfies governance requirements before classification proceeds.

4. Define Governance Response

Establish procedures for missing context, incomplete contextual information, conflicting contextual data, reassessment requirements, corrective actions, and governance escalation.

5. Preserve Identification Records

Maintain contextual inventories, identification reports, governance approvals, validation records, revisions, timestamps, and complete governance audit trails throughout the classification lifecycle.

Use Case 1 — Autonomous AI Governance

Scenario

An autonomous AI platform classifies operational events across multiple business environments.

Application

Context Identification Module governs the identification of operational, regulatory, geographical, and business context before any classification decision is executed.

Result

Classification decisions are based on complete contextual information, improving consistency, explainability, and governance reliability.

Use Case 2 — Healthcare Information Classification

Scenario

A healthcare organization classifies patient information under

multiple privacy and regulatory frameworks.

Application

Context Identification Module governs the identification of legal, clinical, operational, and jurisdictional context before assigning information classifications.

Result

Patient information is classified using complete contextual awareness, ensuring regulatory compliance and operational consistency.

Canonical Closing Statement

Context Identification Module establishes the canonical governance framework for identifying contextual information required for trustworthy classification. By governing identification methodology, contextual discovery, governance controls, validation procedures, and continuous context identification, the module enables accurate classification, contextual consistency, accountable governance, and independent verification across all operational domains.
