

Decision Support Module (DSM)

Architecture Ecosystem: Structured Reality Standards™
Architecture Family: CLA™ — Classification Architecture
Parent Standard: Classification Intelligence Standard (CIS)
Operational Layer: Classification Intelligence Governance Layer
Category: Governance & Classification
Subcategory: Classification Governance
Type: Parent Standard Module
Governed Space: Decision Support
Version: 1.0
Status: Canonical · Open Module
Origin Date: 5 August 2026
Compatibility: OOF Methodology OS · GOA™ · OBIDENTITY® · INTEGROS® ·
ORA™ · AGA™ · AIG® · CLIA® ·
MGIA™ · ASGA™ · RIS™
AI-Readable: Yes
Authority: OOF®
Protection: MIP® — Methodological Intellectual Property
Canonical Language: English (UCL)

Governed Space

Decision Support

Canonical Definition

Decision Support Module defines the governance framework for using governed classifications to support consistent, explainable, and evidence-based decision-making. It establishes decision support methodology, governance controls, recommendation principles, decision validation, traceability mechanisms, and continuous decision support governance necessary to ensure that classification-derived recommendations remain reliable, objective, operationally relevant, and independently verifiable.

Operational Role

Decision Support Module governs the decision support layer of classification intelligence by transforming governed classifications into structured recommendations that assist human and autonomous decision-makers while preserving governance integrity and explainability.

Minimum Implementation Framework

1. Define Decision Support Requirements

Establish decision support objectives, governance requirements, recommendation criteria, responsible authorities, operational constraints, and acceptance conditions.

2. Define Decision Support Methodology

Develop standardized procedures for generating recommendations from classifications, documenting decision logic, evaluating operational relevance, maintaining recommendation consistency, and recording decision support outcomes.

3. Define Decision Support Validation Logic

Verify that recommendations are evidence-based, governance-compliant, operationally justified, explainable, reproducible, and aligned with approved classification intelligence.

4. Define Governance Response

Establish procedures for conflicting recommendations, unsupported conclusions, governance exceptions, reassessment requirements, corrective actions, and continuous decision support improvement.

5. Preserve Decision Support Records

Maintain recommendation reports, decision rationales, governance approvals, validation reports, timestamps, responsible authorities, and complete audit trails throughout the intelligence lifecycle.

Use Case 1 — Autonomous AI Governance

Scenario

An autonomous AI platform generates operational recommendations using governed classification intelligence before executing an action.

Application

Decision Support Module governs recommendation methodology, governance validation, operational justification, and explainability of classification-driven decision support.

Result

Decision recommendations remain trustworthy, consistent, governance-compliant, and independently verifiable.

Use Case 2 — Regulatory Decision Support

Scenario

A regulatory authority uses governed classifications to prioritize inspections and determine supervisory actions.

Application

Decision Support Module governs recommendation generation, governance validation, operational consistency, and evidence-based decision support.

Result

Regulatory decisions are supported by transparent, repeatable, and operationally reliable classification intelligence.

Canonical Closing Statement

Decision Support Module establishes the canonical governance framework for supporting evidence-based decisions through governed classifications. By governing decision support methodology, recommendation generation, governance controls, validation procedures, operational justification, and continuous decision support governance, the module enables trustworthy classification intelligence, operational confidence, accountable governance, and independent verification across all operational domains.
