

Intelligence Validation Module (IVM)

Architecture Ecosystem: Structured Reality Standards™
Architecture Family: CLA™ — Classification Architecture
Parent Standard: Classification Intelligence Standard (CIS)
Operational Layer: Classification Intelligence Governance Layer
Category: Governance & Classification
Subcategory: Classification Governance
Type: Parent Standard Module
Governed Space: Intelligence Validation
Version: 1.0
Status: Canonical · Open Module
Origin Date: 5 August 2026
Compatibility: OOF Methodology OS · GOA™ · OBIDENTITY® · INTEGROS® ·
ORA™ · AGA™ · AIG® · CLIA® ·
MGIA™ · ASGA™ · RIS™
AI-Readable: Yes
Authority: OOF®
Protection: MIP® — Methodological Intellectual Property
Canonical Language: English (UCL)

Governed Space

Intelligence Validation

Canonical Definition

Intelligence Validation Module defines the governance framework for validating intelligence generated from governed classifications. It establishes validation methodology, governance controls, evidence requirements, consistency verification, operational validation, and continuous intelligence validation necessary to ensure that classification-derived intelligence remains accurate, reliable, explainable, governance-compliant, and independently verifiable.

Operational Role

Intelligence Validation Module governs the validation layer of classification intelligence by independently confirming that analytical interpretations, reasoning processes, operational insights, and decision-support outputs satisfy established governance and methodological requirements.

Minimum Implementation Framework

1. Define Validation Requirements

Establish intelligence validation objectives, governance requirements, validation criteria, evidence thresholds, responsible authorities, and acceptance conditions.

2. Define Validation Methodology

Develop standardized procedures for validating classification-derived intelligence, reviewing analytical outputs, confirming reasoning quality, documenting validation activities, and maintaining intelligence assurance.

3. Define Validation Logic

Verify that generated intelligence is evidence-based, logically consistent, governance-compliant, operationally reliable, explainable, reproducible, and aligned with approved classification methodologies.

4. Define Governance Response

Establish procedures for invalid intelligence, unsupported conclusions, governance exceptions, reassessment requirements, corrective actions, and continuous intelligence improvement.

5. Preserve Validation Records

Maintain intelligence validation reports, governance approvals, supporting evidence, validation history, corrective actions, timestamps, responsible authorities, and complete audit trails throughout the intelligence lifecycle.

Use Case 1 — Autonomous AI Governance

Scenario

An autonomous AI platform validates classification-derived intelligence before using it to support autonomous operational decisions.

Application

Intelligence Validation Module governs validation methodology, evidence verification, governance compliance, reasoning assessment, and operational approval.

Result

Only validated, explainable, and governance-compliant intelligence is used to support autonomous AI operations.

Use Case 2 — Regulatory Intelligence Assessment

Scenario

A regulatory authority validates intelligence generated from classified operational data before initiating supervisory actions.

Application

Intelligence Validation Module governs evidence review, analytical validation, governance compliance, operational verification, and approval of regulatory intelligence.

Result

Regulatory intelligence remains trustworthy, objective, operationally reliable, and independently verifiable.

Canonical Closing Statement

Intelligence Validation Module establishes the canonical governance framework for validating classification- derived intelligence. By governing validation methodology, evidence verification, governance controls, analytical consistency, operational validation, and continuous intelligence assurance, the module enables trustworthy classification intelligence, operational confidence, accountable governance, and independent verification across all operational domains.
