

Classification Compatibility Module (CCM)

Architecture Ecosystem: Structured Reality Standards™
Architecture Family: CLA™ — Classification Architecture
Parent Standard: Classification Interoperability Standard (CIS)
Operational Layer: Classification Interoperability Governance Layer
Category: Governance & Classification
Subcategory: Classification Governance
Type: Parent Standard Module
Governed Space: Classification Compatibility
Version: 1.0
Status: Canonical · Open Module
Origin Date: 5 August 2026
Compatibility: OOF Methodology OS · GOA™ · OBIDENTITY® · INTEGROS® ·
ORA™ · AGA™ · AIG® · CLIA® ·
MGIA™ · ASGA™ · RIS™
AI-Readable: Yes
Authority: OOF®
Protection: MIP® — Methodological Intellectual Property
Canonical Language: English (UCL)

Governed Space

Classification Compatibility

Canonical Definition

Classification Compatibility Module defines the governance framework for evaluating, maintaining, and validating compatibility between classifications across different systems, organizations, platforms, and governance environments. It establishes compatibility methodology, governance controls, compatibility criteria, structural consistency requirements, and continuous compatibility validation necessary to ensure that classifications remain operationally consistent, reusable, interoperable, and independently verifiable.

Operational Role

Classification Compatibility Module governs the compatibility layer of classification interoperability by ensuring that classifications preserve their structural integrity, semantic meaning, and operational behavior when exchanged or reused across heterogeneous environments.

Minimum Implementation Framework

1. Define Compatibility Requirements

Establish compatibility objectives, governance requirements, structural compatibility criteria, semantic consistency requirements, responsible authorities, and acceptance conditions.

2. Define Compatibility Methodology

Develop standardized procedures for assessing compatibility, comparing classification structures, evaluating semantic consistency, documenting compatibility results, and maintaining interoperability.

3. Define Compatibility Validation Logic

Verify that classifications remain structurally compatible, semantically equivalent, governance-compliant, operationally reusable, and suitable for cross-domain interoperability.

4. Define Governance Response

Establish procedures for incompatibilities, structural conflicts, governance exceptions, reassessment requirements, corrective actions, and compatibility improvement.

5. Preserve Compatibility Records

Maintain compatibility assessments, validation reports, governance approvals, identified conflicts, corrective actions, timestamps, responsible authorities, and complete audit trails throughout the interoperability lifecycle.

Use Case 1 — Autonomous AI Governance

Scenario

Two autonomous AI platforms exchange operational classifications to coordinate decision-making across different environments.

Application

Classification Compatibility Module governs compatibility assessment, structural validation, semantic consistency evaluation, governance compliance, and interoperability verification.

Result

Both AI systems exchange classifications without losing operational meaning, governance integrity, or interoperability.

Use Case 2 — Regulatory Classification Exchange

Scenario

A regulatory authority evaluates whether an international classification framework is compatible with its national classification system.

Application

Classification Compatibility Module governs structural comparison, compatibility assessment, semantic validation, governance review, and interoperability approval.

Result

Compatible classifications can be adopted or exchanged while preserving governance consistency, operational reliability, and independent verification.

Canonical Closing Statement

Classification Compatibility Module establishes the canonical governance framework for ensuring compatibility between classifications across operational environments. By governing compatibility methodology, structural consistency, semantic validation, governance controls, interoperability assessment, and continuous compatibility verification, the module enables trustworthy classification interoperability, operational continuity, accountable governance, and independent verification across all operational domains.
