

Classification Interoperability Standard (CIS)

OriginID: OOF-OID-CLA-CIS-2026-08-05-0008

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: CLA™ — Classification Architecture

Operational Layer: Classification Interoperability Governance Layer

Category: Governance & Classification

Subcategory: Classification Governance

Type: Parent Standard

Governed Space: Classification Interoperability

Version: 1.0

Status: Canonical · Open Standard

Origin Date: 5 August 2026

Compatibility: OOF Methodology OS · GOA™ · OBIDENITY® · INTEGROS® ·

ORA™ · AGA™ · AIG® · CLIA® ·

MGIA™ · ASGA™ · RIS™

AI-Readable: Yes

Authority: OOF®

Protection: MIP® — Methodological Intellectual Property

Canonical Language: English (UCL)

Governed Space

Classification Interoperability

Core Question

How can classifications remain structurally compatible, consistently interpreted, and operationally interoperable across different systems, organizations, domains, and governance environments?

Canonical Definition

Classification Interoperability Standard defines the governance

conditions required to enable classifications to operate consistently across different systems, organizations, platforms, domains, and governance environments. It establishes interoperability methodology, governance controls, compatibility principles, mapping mechanisms, translation rules, consistency validation, and interoperability management necessary to ensure that classifications preserve their meaning, integrity, and operational reliability whenever they are exchanged or reused.

Governance Flow Position

Classification Foundation → Classification Criteria → Classification Decision → Classification Integrity → Classification Validation → Classification Lifecycle → Classification Registry → Classification Interoperability → Classification Intelligence → Classification Assurance

Standard Abstract

A classification loses value if it cannot be consistently understood outside the system where it was created.

Organizations increasingly exchange classifications across platforms, regulatory environments, AI systems, and operational domains. Without governed interoperability, classifications may become inconsistent, ambiguous, or incompatible.

Classification Interoperability Standard establishes the governance framework that enables classifications to remain compatible, transferable, consistently interpreted, and operationally reliable across heterogeneous environments.

Operational Role

Classification Interoperability Standard governs the interoperability layer of classification governance by establishing standardized methods for compatibility, mapping, translation, synchronization, consistency validation, and cross-domain operational use.

Operational Space

Classification Interoperability Standard governs:

- classification interoperability,
 - classification compatibility,
 - classification mapping,
 - classification translation,
 - classification synchronization,
 - interoperability validation,
 - interoperability governance.
-

Why This Standard Exists

Modern organizations rarely operate within a single classification environment.

Classifications must remain compatible across AI systems, organizations, regulators, digital platforms, and operational ecosystems without losing meaning or governance integrity.

Classification Interoperability Standard exists because

Classification Interoperability represents the **eighth governed space** of **CLA™ — Classification Architecture**, enabling trusted cross-system classification governance.

Scope

This standard may be applied across:

- AI systems,
 - autonomous systems,
 - cybersecurity,
 - digital forensics,
 - financial services,
 - healthcare,
 - industrial operations,
 - regulatory compliance,
 - critical infrastructure,
 - digital identities,
 - operational governance,
 - and any governed environment requiring interoperable classifications.
-

Relationship to Other OOF Architectures

Classification Interoperability Standard interoperates with:

- **GOA™**
- **OBIDENTITY®**
- **INTEGROS®**
- **ORA™**
- **AGA™**
- **AIG®**
- **CLIA®**
- **MGIA™**
- **ASGA™**
- **RIS™**

by providing the canonical methodology for classification compatibility, mapping, interoperability, semantic consistency, and trusted cross-domain classification exchange.

Foundational Principle

A classification creates value only when it can be consistently understood wherever it is used.

Canonical Closing Statement

Classification Interoperability Standard establishes the canonical governance framework for enabling interoperable classifications across operational environments. By governing interoperability methodology, compatibility, mapping, translation, synchronization, validation, and continuous interoperability governance, the standard enables trustworthy classification exchange, operational continuity, accountable governance, and independent verification across all operational domains.
