

Classification Retirement Module (CRM)

Architecture Ecosystem: Structured Reality Standards™
Architecture Family: CLA™ — Classification Architecture
Parent Standard: Classification Lifecycle Standard (CLS)
Operational Layer: Classification Lifecycle Governance Layer
Category: Governance & Classification
Subcategory: Classification Governance
Type: Parent Standard Module
Governed Space: Classification Retirement
Version: 1.0
Status: Canonical · Open Module
Origin Date: 4 August 2026
Compatibility: OOF Methodology OS · GOA™ · OBIDENTITY® · INTEGROS® ·
ORA™ · AGA™ · AIG® · CLIA® ·
MGIA™ · ASGA™ · RIS™
AI-Readable: Yes
Authority: OOF®
Protection: MIP® — Methodological Intellectual Property
Canonical Language: English (UCL)

Governed Space

Classification Retirement

Canonical Definition

Classification Retirement Module defines the governance framework for formally retiring classifications that are no longer valid, operationally relevant, or suitable for continued use. It establishes retirement methodology, governance controls, retirement criteria, transition management, preservation requirements, and retirement traceability necessary to ensure that obsolete classifications are deactivated in a controlled, transparent, and independently verifiable manner.

Operational Role

Classification Retirement Module governs the retirement layer of classification lifecycle governance by ensuring that obsolete classifications are systematically evaluated, formally retired, historically preserved, and safely removed from operational use.

Minimum Implementation Framework

1. Define Retirement Requirements

Establish retirement objectives, governance requirements, retirement criteria, responsible authorities, transition conditions, and approval requirements.

2. Define Retirement Methodology

Develop standardized procedures for identifying obsolete classifications, evaluating retirement eligibility, approving retirement, documenting retirement decisions, and managing operational transitions.

3. Define Retirement Validation Logic

Verify that retirement decisions satisfy governance requirements, preserve historical traceability, maintain operational continuity, and properly transition to replacement classifications where applicable.

4. Define Governance Response

Establish procedures for disputed retirements, emergency retirements, governance exceptions, rollback requirements, transition failures, and corrective actions.

5. Preserve Retirement Records

Maintain retirement decisions, governance approvals, transition documentation, historical references, validation reports, timestamps, responsible authorities, and complete audit trails throughout the classification lifecycle.

Use Case 1 — Autonomous AI Governance

Scenario

An autonomous AI platform permanently retires an outdated classification model after deploying a more accurate replacement.

Application

Classification Retirement Module governs retirement approval, transition planning, historical preservation, governance validation, and controlled deactivation of the obsolete classification.

Result

Obsolete classifications are safely retired while preserving complete historical traceability and operational continuity.

Use Case 2 — Regulatory Classification Framework

Scenario

A regulatory authority withdraws an obsolete classification framework and replaces it with a modern standardized version.

Application

Classification Retirement Module governs formal retirement, governance approval, transition planning, preservation of historical records, and documentation of the retired classification.

Result

Retired classifications remain historically traceable while operational environments transition safely to the new framework.

Canonical Closing Statement

Classification Retirement Module establishes the canonical governance framework for retiring classifications throughout their complete lifecycle. By governing retirement methodology, governance controls, transition management, historical preservation, validation, and retirement traceability, the module enables trustworthy classification lifecycle management, operational continuity, accountable governance, and independent verification across all operational domains.
