

Classification Versioning Module (CVM)

Architecture Ecosystem: Structured Reality Standards™
Architecture Family: CLA™ — Classification Architecture
Parent Standard: Classification Lifecycle Standard (CLS)
Operational Layer: Classification Lifecycle Governance Layer
Category: Governance & Classification
Subcategory: Classification Governance
Type: Parent Standard Module
Governed Space: Classification Versioning
Version: 1.0
Status: Canonical · Open Module
Origin Date: 4 August 2026
Compatibility: OOF Methodology OS · GOA™ · OBIDENTITY® · INTEGROS® ·
ORA™ · AGA™ · AIG® · CLIA® ·
MGIA™ · ASGA™ · RIS™
AI-Readable: Yes
Authority: OOF®
Protection: MIP® — Methodological Intellectual Property
Canonical Language: English (UCL)

Governed Space

Classification Versioning

Canonical Definition

Classification Versioning Module defines the governance framework for creating, managing, tracking, and preserving versions of classifications throughout their complete lifecycle. It establishes versioning methodology, governance controls, version identification, change traceability, compatibility management, and historical preservation necessary to ensure that every classification version remains uniquely identifiable, reproducible, traceable, and independently verifiable.

Operational Role

Classification Versioning Module governs the version management layer of classification lifecycle governance by ensuring that every classification revision is uniquely identified, historically preserved, and operationally traceable.

Minimum Implementation Framework

1. Define Versioning Requirements

Establish versioning objectives, governance requirements, version identification rules, compatibility requirements, responsible authorities, and version approval conditions.

2. Define Versioning Methodology

Develop standardized procedures for assigning version identifiers, documenting version changes, preserving historical versions, managing compatibility, and maintaining version continuity.

3. Define Versioning Validation Logic

Verify that every version is uniquely identified, properly documented, governance-approved, historically preserved, traceable to previous versions, and operationally reproducible.

4. Define Governance Response

Establish procedures for version conflicts, incompatible versions, undocumented revisions, governance exceptions, rollback requirements, and corrective actions.

5. Preserve Version Records

Maintain version histories, governance approvals, change documentation, compatibility records, validation reports, timestamps, responsible authorities, and complete audit trails throughout the classification lifecycle.

Use Case 1 — Autonomous AI Governance

Scenario

An autonomous AI platform periodically updates its operational classification models as new knowledge becomes available.

Application

Classification Versioning Module governs creation of new versions, historical preservation, compatibility management, governance approval, and complete version traceability.

Result

Every operational classification version remains uniquely identifiable, historically preserved, and independently verifiable throughout its lifecycle.

Use Case 2 — Regulatory Classification Framework

Scenario

A regulatory authority publishes multiple revisions of an official classification framework over several years.

Application

Classification Versioning Module governs version identification, historical preservation, compatibility documentation, governance validation, and long-term version traceability.

Result

Organizations can accurately identify, reproduce, compare, and verify every historical and current classification version with complete governance transparency.

Canonical Closing Statement

Classification Versioning Module establishes the canonical governance framework for managing classification versions throughout their complete lifecycle. By governing versioning methodology, version identification, historical preservation, compatibility management, governance controls, and version traceability, the module enables trustworthy classification evolution, operational continuity, accountable governance, and independent verification across all operational domains.
