

Classification Identification Module (CIM)

Architecture Ecosystem: Structured Reality Standards™
Architecture Family: CLA™ — Classification Architecture
Parent Standard: Classification Registry Standard (CRS)
Operational Layer: Classification Registry Governance Layer
Category: Governance & Classification
Subcategory: Classification Governance
Type: Parent Standard Module
Governed Space: Classification Identification
Version: 1.0
Status: Canonical · Open Module
Origin Date: 5 August 2026
Compatibility: OOF Methodology OS · GOA™ · OBIDENTITY® · INTEGROS® ·
ORA™ · AGA™ · AIG® · CLIA® ·
MGIA™ · ASGA™ · RIS™
AI-Readable: Yes
Authority: OOF®
Protection: MIP® — Methodological Intellectual Property
Canonical Language: English (UCL)

Governed Space

Classification Identification

Canonical Definition

Classification Identification Module defines the governance framework for uniquely identifying classifications within an authoritative registry. It establishes identification methodology, governance controls, identifier assignment principles, uniqueness validation, identifier persistence, and traceability mechanisms necessary to ensure that every classification remains uniquely identifiable, unambiguous, persistent, and independently verifiable throughout its complete lifecycle.

Operational Role

Classification Identification Module governs the identification layer of classification registry governance by assigning and preserving unique identifiers that distinguish every classification from all others throughout its operational lifecycle.

Minimum Implementation Framework

1. Define Identification Requirements

Establish identification objectives, governance requirements, identifier structure, uniqueness criteria, responsible authorities, and identifier persistence requirements.

2. Define Identification Methodology

Develop standardized procedures for generating, assigning, validating, documenting, and maintaining unique classification identifiers.

3. Define Identification Validation Logic

Verify that every identifier is unique, governance-compliant, permanently associated with its classification, non-conflicting, and fully traceable throughout the classification lifecycle.

4. Define Governance Response

Establish procedures for duplicate identifiers, identification conflicts, governance exceptions, reassignment requirements, corrective actions, and identifier resolution.

5. Preserve Identification Records

Maintain identifier assignments, governance approvals, validation reports, identifier history, timestamps, responsible authorities, and complete audit trails throughout the registry lifecycle.

Use Case 1 — Autonomous AI Governance

Scenario

An autonomous AI platform manages thousands of operational classifications that require permanent and unique identifiers.

Application

Classification Identification Module governs generation, assignment, validation, and long-term preservation of unique identifiers for every classification.

Result

Every classification remains uniquely identifiable, traceable, governance-compliant, and independently verifiable throughout its operational lifecycle.

Use Case 2 — Regulatory Classification Registry

Scenario

A regulatory authority assigns permanent identifiers to official

classification frameworks used across regulated organizations.

Application

Classification Identification Module governs identifier assignment, uniqueness validation, governance compliance, and long-term identifier management.

Result

Official classifications remain uniquely identifiable, transparent, traceable, and consistently referenced across all regulatory environments.

Canonical Closing Statement

Classification Identification Module establishes the canonical governance framework for uniquely identifying classifications within authoritative registries. By governing identification methodology, identifier assignment, uniqueness validation, governance controls, identifier persistence, and traceability, the module enables trustworthy classification identification, operational continuity, accountable governance, and independent verification across all operational domains.
