

Classification Boundary Module (CBM)

Architecture Ecosystem: Structured Reality Standards™
Architecture Family: CLA™ — Classification Architecture
Parent Standard: Classification Scope Standard (CSS)
Operational Layer: Classification Scope Governance Layer
Category: AI & Interpretation
Subcategory: Classification Governance
Type: Parent Standard Module
Governed Space: Classification Boundaries
Version: 1.0
Status: Canonical · Open Module
Origin Date: 3 August 2026
Compatibility: OOF Methodology OS · GOA™ · OBIDENITY® · INTEGROS® ·
ORA™ · AGA™ · AIG® · CLIA® ·
MGIA™ · ASGA™ · ADIT® · RIS™
AI-Readable: Yes
Authority: OOF®
Protection: MIP™ — Methodological Intellectual Property
Canonical Language: English (UCL)

Governed Space

Classification Boundaries

Canonical Definition

Classification Boundary Module defines the governance framework for establishing, governing, validating, and maintaining the operational boundaries within which classification activities remain authorized and methodologically valid. It establishes boundary identification methodology, governance controls, operational limits, transition rules, validation mechanisms, and continuous boundary management necessary to ensure that classification never extends beyond its approved governance boundaries.

Operational Role

Classification Boundary Module governs the boundary layer of classification governance by ensuring that every classification activity remains confined to clearly established, governance-approved, and methodologically valid operational boundaries.

Minimum Implementation Framework

1. Define Boundary Requirements

Establish operational limits, boundary conditions, governance constraints, transition points, responsible authorities, and boundary acceptance criteria.

2. Define Boundary Methodology

Develop standardized procedures for identifying, documenting, validating, monitoring, and maintaining classification boundaries throughout the complete classification lifecycle.

3. Define Boundary Validation Logic

Verify that classification boundaries remain complete, objective, governance-compliant, consistently applied, operationally enforceable, and independently reproducible.

4. Define Governance Response

Establish procedures for boundary violations, undefined boundaries, governance exceptions, boundary revisions, corrective actions, reassessment activities, and continuous boundary improvement.

5. Preserve Boundary Records

Maintain boundary definitions, governance approvals, validation reports, boundary revisions, operational decisions, supporting documentation, timestamps, and complete governance audit trails throughout the classification lifecycle.

Use Case 1 — AI Model Classification

Scenario

An organization classifies AI models according to operational risk but must clearly separate research models from production systems.

Application

Classification Boundary Module governs the establishment and validation of operational boundaries that distinguish which AI models are included within the governed classification framework.

Result

Classification remains consistent, governance-valid, and protected from unintended expansion beyond approved operational limits.

Use Case 2 — Cross-Border Regulatory Classification

Scenario

An international regulatory framework defines which organizations

fall within its classification authority and which remain outside its jurisdiction.

Application

Classification Boundary Module governs the documentation, validation, and enforcement of jurisdictional and operational boundaries before classifications are performed.

Result

Classification boundaries remain transparent, enforceable, methodologically consistent, and independently verifiable across multiple governance environments.

Canonical Closing Statement

Classification Boundary Module establishes the canonical governance framework for governing the operational boundaries of classification. By governing boundary methodology, operational limits, governance controls, validation mechanisms, documentation, and continuous boundary management, the module enables objective classification, methodological discipline, governance certainty, and trustworthy classification across all operational domains.
