

Classification Consistency Module (CCM)

Architecture Ecosystem: Structured Reality Standards™
Architecture Family: CLA™ — Classification Architecture
Parent Standard: Classification Validation Standard (CVS)
Operational Layer: Classification Validation Governance Layer
Category: Governance & Classification
Subcategory: Classification Governance
Type: Parent Standard Module
Governed Space: Classification Consistency
Version: 1.0
Status: Canonical · Open Module
Origin Date: 4 August 2026
Compatibility: OOF Methodology OS · GOA™ · OBIDENTITY® · INTEGROS® ·
ORA™ · AGA™ · AIG® · CLIA® ·
MGIA™ · ASGA™ · RIS™
AI-Readable: Yes
Authority: OOF®
Protection: MIP® — Methodological Intellectual Property
Canonical Language: English (UCL)

Governed Space

Classification Consistency

Canonical Definition

Classification Consistency Module defines the governance framework for ensuring that equivalent objects, events, entities, conditions, and situations are classified consistently throughout their complete lifecycle. It establishes consistency methodology, governance controls, comparison mechanisms, validation criteria, and continuous consistency governance necessary to ensure that classification decisions remain uniform, reproducible, predictable, and independently verifiable across all operational environments.

Operational Role

Classification Consistency Module governs the consistency layer of classification governance by ensuring that similar classification cases produce consistent outcomes when evaluated under the same governance rules and methodology.

Minimum Implementation Framework

1. Define Consistency Requirements

Establish consistency objectives, governance requirements, comparison criteria, acceptable variance thresholds, responsible authorities, and consistency acceptance conditions.

2. Define Consistency Methodology

Develop standardized procedures for comparing classification decisions, identifying inconsistencies, evaluating classification uniformity, and documenting consistency assessments.

3. Define Consistency Validation Logic

Verify that equivalent classification cases produce consistent outcomes, follow identical governance principles, satisfy methodological requirements, and remain reproducible across different operational contexts.

4. Define Governance Response

Establish procedures for inconsistent classifications, governance deviations, methodological conflicts, reassessment requirements, corrective actions, and consistency improvement initiatives.

5. Preserve Consistency Records

Maintain consistency assessments, comparison reports, governance decisions, validation history, corrective actions, timestamps, and complete audit trails throughout the classification lifecycle.

Use Case 1 — Autonomous AI Governance

Scenario

An autonomous AI platform repeatedly classifies similar operational situations across multiple deployments.

Application

Classification Consistency Module governs comparison of classification outcomes to verify that equivalent situations receive identical classifications under the same governance methodology.

Result

Classification decisions remain predictable, uniform, and operationally trustworthy across all deployments.

Use Case 2 — Regulatory Classification Oversight

Scenario

A regulatory authority evaluates whether multiple organizations

consistently classify identical compliance events.

Application

Classification Consistency Module governs consistency assessment, comparison methodology, governance validation, and identification of classification deviations.

Result

Classification practices become standardized, transparent, and independently verifiable across regulated environments.

Canonical Closing Statement

Classification Consistency Module establishes the canonical governance framework for ensuring consistent classification decisions throughout the complete classification lifecycle. By governing consistency methodology, comparison mechanisms, governance controls, validation criteria, and continuous consistency governance, the module enables trustworthy classification, operational confidence, accountable governance, and independent verification across all operational domains.
