

Classification Verification Module (CVM)

Architecture Ecosystem: Structured Reality Standards™
Architecture Family: CLA™ — Classification Architecture
Parent Standard: Classification Validation Standard (CVS)
Operational Layer: Classification Validation Governance Layer
Category: Governance & Classification
Subcategory: Classification Governance
Type: Parent Standard Module
Governed Space: Classification Verification
Version: 1.0
Status: Canonical · Open Module
Origin Date: 4 August 2026
Compatibility: OOF Methodology OS · GOA™ · OBIDENTITY® · INTEGROS® ·
ORA™ · AGA™ · AIG® · CLIA® ·
MGIA™ · ASGA™ · RIS™
AI-Readable: Yes
Authority: OOF®
Protection: MIP® — Methodological Intellectual Property
Canonical Language: English (UCL)

Governed Space

Classification Verification

Canonical Definition

Classification Verification Module defines the governance framework for independently verifying that classification decisions have been correctly performed in accordance with established methodology, governance rules, and supporting evidence. It establishes verification methodology, governance controls, verification criteria, review mechanisms, and continuous verification governance necessary to ensure that every classification remains accurate, justified, reproducible, and independently verifiable.

Operational Role

Classification Verification Module governs the verification layer of classification governance by independently confirming that classification decisions correctly satisfy established classification criteria, evidence requirements, and governance policies.

Minimum Implementation Framework

1. Define Verification Requirements

Establish verification objectives, governance requirements, verification criteria, evidence thresholds, responsible authorities, and acceptance conditions.

2. Define Verification Methodology

Develop standardized procedures for independently reviewing classification decisions, evaluating supporting evidence, verifying governance compliance, and documenting verification results.

3. Define Verification Validation Logic

Verify that classification decisions are evidence-based, methodologically correct, governance-compliant, reproducible, and fully supported by documented validation activities.

4. Define Governance Response

Establish procedures for failed verification, incorrect classifications, governance exceptions, reassessment requirements, corrective actions, and verification escalation.

5. Preserve Verification Records

Maintain verification reports, supporting evidence, governance approvals, validation history, corrective actions, timestamps, and complete audit trails throughout the classification lifecycle.

Use Case 1 — Autonomous AI Governance

Scenario

An autonomous AI platform performs independent verification before operational classifications are accepted for automated decision-making.

Application

Classification Verification Module governs independent verification of classification methodology, supporting evidence, governance compliance, and final classification accuracy.

Result

Only independently verified classifications are approved for operational use, increasing governance reliability and decision confidence.

Use Case 2 — Regulatory Classification Oversight

Scenario

A regulatory authority independently verifies classifications submitted during regulatory compliance assessments.

Application

Classification Verification Module governs verification of classification methodology, supporting evidence, governance consistency, and operational correctness before regulatory acceptance.

Result

Classification decisions become independently verified, transparent, reproducible, and suitable for regulatory reliance.

Canonical Closing Statement

Classification Verification Module establishes the canonical governance framework for independently verifying classification decisions. By governing verification methodology, evidence evaluation, governance controls, verification criteria, and continuous verification governance, the module enables trustworthy classification, operational confidence, accountable governance, and independent verification across all operational domains.
