

About the Capability Readiness Governance

Standard (CRGS)

Canonical Definition

Capability Readiness Governance Standard (CRGS) defines the structural conditions under which actors, systems, organizations, contractors, agents, tools, resources, qualifications, competencies, permissions, information, and operational environments remain capable of performing assigned responsibilities in a valid, traceable, governable, accountable, and operationally reliable manner.

CRGS governs capability readiness.

The standard establishes the foundational conditions required to determine whether a responsible actor is actually capable of performing the responsibility assigned to them.

What This Standard Is

CRGS is a parent standard of the Accountability Governance Architecture (AGA™).

It governs:

- capability readiness
- qualification readiness
- competency readiness
- certification readiness
- execution readiness
- tool readiness
- resource readiness
- operational readiness
- Human-AI capability readiness
- agent capability readiness

CRGS establishes the governance layer responsible for determining whether execution capability actually exists before operational activities begin.

What This Standard Is Not

CRGS is not:

- a responsibility standard
 - an authority standard
 - a delegation standard
 - a validation standard
 - an escalation standard
-

- a control standard
- an oversight standard

CRGS does not determine who should perform a task.

CRGS determines whether the assigned actor is capable of performing the task.

Why This Standard Exists

Many operational failures occur because governance assumes capability instead of verifying capability.

Organizations often verify:

- authority
- responsibility
- approvals
- permissions

while failing to verify:

- qualifications
- competencies
- certifications
- tools
- resources
- operational conditions
- information availability
- execution readiness

As a result:

- accidents occur
- quality failures occur
- compliance failures occur
- contractor failures occur
- certification failures occur
- AI failures occur

The challenge is not assigning responsibility.

The challenge is ensuring capability exists.

CRGS exists because capability readiness has become a distinct governance space.

Core Insight

Responsibility creates obligation. Capability enables execution.

Operational Architecture Space

CRGS defines the operational architecture space for:

- capability readiness governance
- qualification governance
- competency governance
- certification readiness
- execution readiness
- tool readiness
- resource readiness
- operational readiness
- Human-AI capability governance
- agent capability governance
- execution capability validation

This space exists because governance must verify capability before expecting execution.

CRGS governs whether capability remains sufficient.

General Use Case 1 — Contractor & Workforce Environment

Scenario

A company assigns a contractor to perform a critical operational task requiring specific qualifications, certifications, tools, documentation, and equipment.

Application

CRGS evaluates whether the assigned contractor possesses the actual capability required for execution.

The evaluation may include:

- qualifications
- certifications
- competencies
- equipment availability
- tool readiness
- documentation access
- operational resources

Result

Governance gains visibility into whether the assigned actor is

genuinely capable of performing the task.

General Use Case 2 — Human-AI Operational Environment

Scenario

An orchestration platform assigns responsibilities to AI agents responsible for executing operational tasks.

Application

CRGS evaluates whether the AI agent possesses the required:

- permissions
- tools
- models
- system access
- operational resources
- execution capabilities

Result

Governance gains visibility into whether the AI agent is actually capable of performing the assigned responsibility.

Architectural Position

Within AGA™, CRGS serves as the seventh foundational governance layer.

The architecture progresses:

Relationship → Authority → Authority Delegation → Authority Validation → Authority Escalation → Responsibility → Capability → Control → Oversight → Evidence → Accountability → Consequence

CRGS governs whether a responsible actor is capable of execution before governance evaluates operational control, oversight, accountability, or consequences.

Strategic Importance

CRGS addresses one of the most common governance failures in operational reality:

The assumption that assigned responsibility automatically implies execution capability.

This assumption frequently proves false.

An actor may possess:

- authority
- responsibility
- permissions
- approvals

while lacking:

- competency
- qualification
- resources
- equipment
- operational readiness

CRGS exists to expose this gap before operational failure occurs.

Closing Definition

Capability readiness is not the existence of responsibility.

Capability readiness is the governed condition under which a responsible actor possesses the qualifications, competencies, certifications, tools, resources, permissions, information, and operational conditions required for successful execution.

Governance cannot require execution from actors that are not capable of execution. Before responsibility can be fulfilled, capability must first be demonstrated.
