

CQOIM — Capability Qualification Origin Integrity Module

OriginID: OOF-OID-AGA-CQOIM-2026-06-14-0031

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Capability Readiness Governance Layer

Governed Space: Capability Qualification Origin Integrity

Category: Governance & Enforcement

Subcategory: Capability Readiness Governance

Type: Capability Readiness Governance Standard Module

Parent Standard: Capability Readiness Governance Standard (CRGS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 14 June 2026

Compatibility: OOF Methodology OS · Capability Readiness Governance

Standard (CRGS) · Responsibility Governance

Standard (RGS) · Authority Validation Standard (AVS) · Relationship

Accountability Standard (RAS) · INTEGROS® —

Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Capability Qualification Origin Integrity Module (CQOIM) defines the structural conditions under which qualifications, certifications, licenses, approvals, competencies, authorizations, training credentials, and capability claims remain attributable to identifiable, legitimate, traceable, governable, accountable, and operationally valid qualification sources throughout the capability lifecycle.

CQOIM governs qualification origin.

The module establishes the integrity conditions required to determine where capability qualifications originated, who issued them, under what authority they were issued, and whether the qualification source remains legitimate.

Module Operational Role

CQOIM defines the qualification-origin governance layer of CRGS.

Its role is to preserve visibility of the sources from which capability qualifications originate.

Module Operational Space

CQOIM governs:

- qualification origin
- certification origin
- competency-source traceability
- qualification attribution
- credential provenance
- qualification legitimacy
- qualification accountability
- capability-source governance

The module applies wherever governance requires verification of capability origins.

Module Function

The module applies wherever systems must preserve:

- identifiable qualification sources
- traceable certification origins
- reconstructable qualification history
- accountable credential issuance
- governance-valid capability attribution
- operationally valid qualification provenance

Its function is to ensure that governance can determine where capability qualifications originated and whether they remain trustworthy.

Minimum Implementation Framework

1. Define the Qualification Origin Object

The organization must define which qualification environments require origin governance.

This may include:

- certification systems
- licensing authorities
- training organizations
- educational institutions
- contractor qualification systems
- workforce validation programs
- AI capability validation frameworks
- Human-AI operational environments

2. Define Qualification Origin Conditions

The system must define the conditions under which qualification origin remains valid.

This includes:

- source-identification requirements
- credential requirements
- traceability requirements
- accountability requirements
- legitimacy requirements
- governance-valid qualification conditions

3. Define Origin Degradation Detection Logic

The system must define how qualification-origin failures are identified.

This may include:

- unverifiable certifications
- unidentified qualification sources
- fraudulent credentials
- undocumented qualifications
- governance-blind certifications
- illegitimate qualification issuers

4. Define Operational Response or Governance Logic

The system must define governance logic for qualification-origin failures.

Governance response may include:

- credential verification
- qualification review
- governance intervention
- qualification reconstruction
- corrective actions
- capability reassessment
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- qualification sources
- certification records
- validation activities
- governance reviews

- intervention procedures
- resulting capability states

A capability-readiness environment must not remain qualification-valid if materially significant qualifications cannot be attributed, reconstructed, reviewed, validated, or governed.

Use Case 1 — Certified Workforce Environment

Scenario

A company assigns a worker to perform specialized welding activities requiring specific certifications and qualifications.

Application

CQOIM reconstructs the origin of qualifications and determines whether certification sources remain legitimate.

Result

Governance gains visibility into the origin and legitimacy of capability qualifications.

Use Case 2 — AI Capability Environment

Scenario

An orchestration platform relies upon capability certifications and validation records before assigning operational responsibilities to AI agents.

Application

CQOIM reconstructs the origin of capability claims and validation credentials.

Result

Governance gains visibility into the source and legitimacy of capability qualifications across intelligent operational systems.

Canonical Closing Statement

Capability Qualification Origin Integrity Module (CQOIM) defines the structural conditions under which qualifications, certifications, licenses, approvals, competencies, authorizations, training credentials, and capability claims remain attributable to identifiable, legitimate, traceable, governable, accountable, and operationally valid qualification sources throughout the capability lifecycle.

Capability cannot be trusted if its qualifications cannot be trusted. Capability qualification origin integrity therefore becomes a foundational condition of trustworthy capability readiness governance.
