

CRAIM — Capability Readiness Accountability Integrity Module

OriginID: OOF-OID-AGA-CRAIM-2026-06-14-0035
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: Accountability Governance Architecture (AGA™)
Operational Layer: Capability Readiness Governance Layer
Governed Space: Capability Readiness Accountability Integrity
Category: Governance & Enforcement
Subcategory: Capability Readiness Governance
Type: Capability Readiness Governance Standard Module
Parent Standard: Capability Readiness Governance Standard (CRGS)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 14 June 2026
Compatibility: OOF Methodology OS · Capability Readiness Governance Standard (CRGS) · Responsibility Governance Standard (RGS) · Accountability Governance Standard (AGS-A) · Evidence Accountability Standard (EAS) · INTEGROS® — Integrity Standard
AI-Readable: Yes
Authority: OOF
Protection: MIP — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Capability Readiness Accountability Integrity Module (CRAIM) defines the structural conditions under which capability-readiness decisions, qualification validations, competency assessments, certification reviews, resource determinations, tool-readiness evaluations, and execution-readiness approvals remain attributable, accountable, traceable, governable, reconstructable, enforceable, and operationally valid throughout the capability lifecycle.

CRAIM governs capability-readiness accountability.

The module establishes the integrity conditions required to determine who was responsible for evaluating capability readiness, who approved readiness, who validated readiness, who ignored readiness deficiencies, and who remains accountable when capability failures occur.

Module Operational Role

CRAIM defines the capability-accountability governance layer of CRGS.

Its role is to ensure that capability-readiness decisions remain

connected to accountable governance actors throughout the execution lifecycle.

Module Operational Space

CRAIM governs:

- capability-readiness accountability
- qualification-validation accountability
- competency-assessment accountability
- readiness-approval accountability
- capability-failure accountability
- execution-readiness accountability
- capability-governance accountability
- consequence attribution

The module applies wherever governance must determine accountability for capability-readiness decisions.

Module Function

The module applies wherever systems must preserve:

- accountable readiness assessments
- attributable validation decisions
- reconstructable capability approvals
- traceable governance actions
- enforceable readiness obligations
- governance-valid accountability structures

Its function is to ensure that governance can determine who is accountable when capability readiness is approved, rejected, ignored, manipulated, or incorrectly assessed.

Minimum Implementation Framework

1. Define the Capability Accountability Object

The organization must define which capability environments require accountability governance.

This may include:

- workforce qualification systems
 - contractor environments
 - certification programs
 - operational execution systems
 - compliance environments
 - quality-control systems
 - AI governance systems
-

- Human-AI operational systems

2. Define Capability Accountability Conditions

The system must define the conditions under which capability accountability remains valid.

This includes:

- attribution requirements
- accountability requirements
- approval requirements
- enforcement requirements
- governance requirements
- accountability-valid capability conditions

3. Define Accountability Degradation Detection Logic

The system must define how capability-accountability failures are identified.

This may include:

- anonymous readiness approvals
- undocumented validation decisions
- accountability gaps
- ignored capability deficiencies
- governance-blind readiness assessments
- unverifiable approval activities

4. Define Operational Response or Governance Logic

The system must define governance logic for capability-accountability failures.

Governance response may include:

- accountability review
- approval verification
- governance intervention
- corrective actions
- reassessment procedures
- enforcement activities
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- readiness approvals
- qualification validations
- capability assessments
- governance reviews
- intervention procedures
- resulting accountability outcomes

A capability-readiness environment must not remain accountability-valid if materially significant readiness decisions cannot be attributed, reconstructed, reviewed, enforced, validated, or governed.

Use Case 1 — Certified Workforce Environment

Scenario

A worker performs a critical task that later results in a quality failure or safety incident.

Application

CRAIM reconstructs who evaluated qualifications, who approved readiness, who validated competencies, and who accepted operational capability.

Result

Governance gains visibility into accountability for capability-readiness decisions and resulting operational outcomes.

Use Case 2 — AI Operational Environment

Scenario

An AI agent is authorized to perform a high-impact operational task but later fails because required capabilities, tools, permissions, or resources were not properly validated.

Application

CRAIM reconstructs who approved readiness, who validated capabilities, and who remained accountable for the readiness decision.

Result

Governance gains visibility into accountability across intelligent operational systems.

Canonical Closing Statement

Capability Readiness Accountability Integrity Module (CRAIM) defines the structural conditions under which capability-readiness decisions, qualification validations, competency assessments, certification reviews, resource determinations, tool-readiness evaluations, and execution-readiness approvals remain attributable, accountable, traceable, governable, reconstructable, enforceable, and operationally valid throughout the capability lifecycle.

Capability failures rarely occur in isolation. Someone evaluates, validates, approves, or ignores readiness. Capability readiness accountability integrity therefore becomes a foundational condition of trustworthy execution governance and operational responsibility assurance.
