

CRTIM — Capability Readiness Traceability Integrity Module

OriginID: OOF-OID-AGA-CRTIM-2026-06-14-0034
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: Accountability Governance Architecture (AGA™)
Operational Layer: Capability Readiness Governance Layer
Governed Space: Capability Readiness Traceability Integrity
Category: Governance & Enforcement
Subcategory: Capability Readiness Governance
Type: Capability Readiness Governance Standard Module
Parent Standard: Capability Readiness Governance Standard (CRGS)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 14 June 2026
Compatibility: OOF Methodology OS · Capability Readiness Governance Standard (CRGS) · Responsibility Governance Standard (RGS) · Evidence Accountability Standard (EAS) · Authority Validation Standard (AVS) · INTEGROS® — Integrity Standard
AI-Readable: Yes
Authority: OOF
Protection: MIP — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Capability Readiness Traceability Integrity Module (CRTIM) defines the structural conditions under which qualifications, competencies, certifications, permissions, tools, resources, capability assessments, readiness decisions, validation activities, and execution-capability determinations remain traceable, reconstructable, reviewable, auditable, governable, and operationally valid throughout the capability lifecycle.

CRTIM governs capability readiness traceability.

The module establishes the integrity conditions required to determine how capability readiness was assessed, what evidence supported readiness, what tools and resources were available, and whether capability readiness can be reconstructed after execution occurs.

Module Operational Role

CRTIM defines the capability-traceability governance layer of CRGS.

Its role is to preserve visibility and reconstructability of

Module Operational Space

CRTIM governs:

- capability traceability
- qualification traceability
- certification traceability
- capability reconstruction
- readiness auditability
- readiness evidence linkage
- capability assessment history
- governance traceability

The module applies wherever governance requires reconstruction of execution capability.

Module Function

The module applies wherever systems must preserve:

- traceable qualifications
- reconstructable capability history
- auditable readiness assessments
- accountable capability validation
- governance-valid capability records
- operational capability transparency

Its function is to ensure that governance can reconstruct capability readiness before, during, and after execution.

Minimum Implementation Framework

1. Define the Capability Traceability Object

The organization must define which capability environments require traceability governance.

This may include:

- workforce qualification systems
- contractor environments
- certification programs
- operational execution systems
- quality-control environments
- AI governance systems
- autonomous-agent environments
- Human-AI operational systems

2. Define Capability Traceability Conditions

The system must define the conditions under which capability traceability remains valid.

This includes:

- traceability requirements
- reconstruction requirements
- evidence requirements
- auditability requirements
- accountability requirements
- governance-valid traceability conditions

3. Define Traceability Degradation Detection Logic

The system must define how capability-traceability failures are identified.

This may include:

- missing qualification records
- undocumented readiness assessments
- incomplete capability history
- evidence gaps
- governance-blind capability validation
- unreconstructable readiness decisions

4. Define Operational Response or Governance Logic

The system must define governance logic for capability-traceability failures.

Governance response may include:

- capability review
- audit procedures
- governance intervention
- readiness reconstruction
- corrective actions
- validation verification
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- qualifications
- certifications

- capability assessments
- readiness validations
- governance reviews
- resulting capability states

A capability-readiness environment must not remain traceability-valid if materially significant capability activities cannot be reconstructed, reviewed, audited, validated, or governed.

Use Case 1 — Certified Workforce Environment

Scenario

A company must demonstrate that a worker possessed the qualifications, certifications, equipment, and operational readiness required to perform a task at a specific point in time.

Application

CRTIM reconstructs readiness assessments, qualification records, equipment availability, and capability-validation history.

Result

Governance gains visibility into whether execution capability can be demonstrated and reconstructed.

Use Case 2 — AI Agent Execution Environment

Scenario

An AI agent executes a high-impact operational task requiring validated permissions, tools, resources, and operational capabilities.

Application

CRTIM reconstructs capability assessments, readiness decisions, system access, and execution-capability evidence.

Result

Governance gains visibility into capability readiness across intelligent operational systems.

Canonical Closing Statement

Capability Readiness Traceability Integrity Module (CRTIM) defines the structural conditions under which qualifications, competencies, certifications, permissions, tools, resources, capability assessments, readiness decisions, validation activities, and execution-capability determinations remain traceable,

reconstructable, reviewable, auditable, governable, and operationally valid throughout the capability lifecycle.

**Capability that cannot be reconstructed cannot be verified.
Capability readiness traceability integrity therefore becomes a
foundational condition of trustworthy execution governance.**
