

CRVIM — Capability Readiness Validity Integrity Module

OriginID: OOF-OID-AGA-CRVIM-2026-06-14-0033
Architecture Ecosystem: Structured Reality Standards™
Architecture Family: Accountability Governance Architecture (AGA™)
Operational Layer: Capability Readiness Governance Layer
Governed Space: Capability Readiness Validity Integrity
Category: Governance & Enforcement
Subcategory: Capability Readiness Governance
Type: Capability Readiness Governance Standard Module
Parent Standard: Capability Readiness Governance Standard (CRGS)
Version: 1.0
Status: Canonical · Open Module
Origin Date: 14 June 2026
Compatibility: OOF Methodology OS · Capability Readiness Governance Standard (CRGS) · Responsibility Governance Standard (RGS) · Authority Validation Standard (AVS) · Authority Governance Standard (AGS) · INTEGROS® — Integrity Standard
AI-Readable: Yes
Authority: OOF
Protection: MIP — Methodological Intellectual Property
Canonical Language: English (UCL)

Canonical Definition

Capability Readiness Validity Integrity Module (CRVIM) defines the structural conditions under which qualifications, competencies, certifications, permissions, tools, resources, operational environments, and execution capabilities remain legitimate, recognized, available, sufficient, governable, accountable, reconstructable, and operationally valid throughout the execution lifecycle.

CRVIM governs capability readiness validity.

The module establishes the integrity conditions required to determine whether capability readiness remains valid at the moment execution occurs.

Having capability in the past does not guarantee capability in the present.

CRVIM governs whether capability remains valid now.

Module Operational Role

CRVIM defines the capability-validity governance layer of CRGS.

Its role is to ensure that capability readiness remains legitimate and operationally valid throughout execution.

Module Operational Space

CRVIM governs:

- capability validity
- qualification validity
- certification validity
- operational readiness validity
- resource availability validity
- tool availability validity
- competency validity
- execution readiness validation

The module applies wherever governance requires confirmation that capability remains valid.

Module Function

The module applies wherever systems must preserve:

- legitimate qualifications
- valid certifications
- available tools
- accessible resources
- recognized competencies
- governance-valid execution readiness

Its function is to ensure that governance can determine whether an actor remains capable of performing assigned responsibilities at the time of execution.

Minimum Implementation Framework

1. Define the Capability Validity Object

The organization must define which capability environments require validity governance.

This may include:

- workforce qualification systems
 - contractor qualification programs
 - certification environments
 - operational execution systems
 - quality-control environments
-

- AI governance systems
- autonomous-agent environments
- Human-AI operational systems

2. Define Capability Validity Conditions

The system must define the conditions under which capability readiness remains valid.

This includes:

- qualification-validity requirements
- certification-validity requirements
- resource-validity requirements
- tool-validity requirements
- accountability requirements
- governance-valid capability conditions

3. Define Validity Degradation Detection Logic

The system must define how capability-validity failures are identified.

This may include:

- expired certifications
- unavailable tools
- inaccessible resources
- invalid permissions
- degraded competencies
- governance-invalid execution conditions

4. Define Operational Response or Governance Logic

The system must define governance logic for capability-validity failures.

Governance response may include:

- capability review
- qualification verification
- governance intervention
- reassignment procedures
- corrective actions
- readiness reassessment
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- qualification records
- certification status
- capability reviews
- validation activities
- intervention procedures
- resulting capability states

A capability-readiness environment must not remain validity-valid if materially significant capability conditions cannot be reconstructed, reviewed, validated, recognized, or governed.

Use Case 1 — Certified Operational Environment

Scenario

A certified worker is assigned a task requiring specific qualifications, equipment, permissions, and operational resources.

Application

CRVIM determines whether all capability conditions remain valid at the time execution begins.

Result

Governance gains visibility into whether execution capability remains operationally valid.

Use Case 2 — Autonomous Agent Environment

Scenario

An AI agent possesses previously validated capabilities but loses access to critical systems, tools, data, or permissions required for execution.

Application

CRVIM determines whether capability readiness remains valid before operational execution proceeds.

Result

Governance gains visibility into real-time capability readiness across intelligent operational systems.

Canonical Closing Statement

Capability Readiness Validity Integrity Module (CRVIM) defines the structural conditions under which qualifications, competencies,

certifications, permissions, tools, resources, operational environments, and execution capabilities remain legitimate, recognized, available, sufficient, governable, accountable, reconstructable, and operationally valid throughout the execution lifecycle.

Capability readiness is not established once and preserved forever.

Capability remains trustworthy only while it remains valid.

Capability readiness validity integrity therefore becomes a foundational condition of trustworthy execution governance.
