

Capability Readiness Governance Standard - (CRGS)

OriginID: OOF-OID-AGA-CRGS-2026-06-14-0007

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Capability Readiness Governance Layer

Governed Space: Capability Readiness Governance

Category: Governance & Enforcement

Subcategory: Accountability Governance Architecture

Type: Parent Standard

Version: 1.0

Status: Canonical · Open Standard

Origin Date: 14 June 2026

Compatibility: OOF Methodology OS · Accountability Governance Architecture (AGA™) · Responsibility Governance Standard (RGS) · Authority Governance Standard (AGS) · Authority Validation Standard (AVS) · Authority Escalation Standard (AES) · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Capability Readiness Governance Standard (CRGS) defines the structural conditions under which actors, systems, organizations, agents, contractors, tools, resources, qualifications, competencies, permissions, and operational environments remain capable of performing assigned responsibilities in a valid, traceable, governable, accountable, and operationally reliable manner.

CRGS governs capability readiness.

The standard establishes the foundational conditions required to determine whether a responsible actor is actually capable of performing the responsibility assigned to them.

Responsibility creates obligation.

Capability enables execution.

CRGS governs whether execution capability exists.

A. Standard Abstract

Many governance failures occur because responsibilities are assigned to actors that are not capable of performing them.

Examples include:

- unqualified personnel
- insufficient training
- invalid certifications
- missing tools
- missing resources
- missing permissions
- missing information
- inaccessible systems
- under-equipped teams
- incapable AI agents

The challenge is not assigning responsibility.

The challenge is determining whether execution capability actually exists.

CRGS exists to govern these conditions.

B. Core Principle

Responsibility becomes operationally executable only when the responsible actor remains capability-ready throughout the execution lifecycle.

C. Scope

This standard may apply to:

- organizations
- institutions
- governments
- contractor networks
- subcontractor chains
- temporary workforce environments
- certification environments
- quality-control systems
- AI systems
- autonomous agents
- orchestrated agent systems
- Human-AI operational environments
- robotics ecosystems
- future intelligent governance systems

CRGS applies wherever execution capability matters.

D. Why This Standard Exists

Responsibility does not guarantee capability.

Authority does not guarantee capability.

Validation does not guarantee capability.

An actor may possess:

- authority
- responsibility
- permissions
- certifications

and still be unable to perform the required task.

Capability readiness failures often occur because:

- qualifications are insufficient
- competencies are inadequate
- tools are unavailable
- resources are missing
- systems are inaccessible
- information is incomplete
- operational conditions are unsuitable

CRGS exists because capability readiness has become a distinct governance space.

E. Capability Readiness Integrity Logic

Capability readiness integrity exists only when the following remain materially preservable:

1. Capability Qualification Origin Integrity

Qualifications remain attributable to legitimate qualification sources.

2. Capability Competency Scope Integrity

Capabilities remain connected to clearly defined competency boundaries.

3. Capability Readiness Validity Integrity

Capability readiness remains legitimate, recognized, and operationally valid.

4. Capability Readiness Traceability Integrity

Capability readiness remains reconstructable throughout the execution lifecycle.

5. Capability Readiness Accountability Integrity

Capability readiness remains connected to accountable governance structures.

F. Operational Architecture Space

CRGS defines the operational architecture space for:

- capability readiness governance
- qualification governance
- competency governance
- certification readiness
- execution readiness
- tool readiness
- resource readiness
- operational readiness
- Human-AI capability governance
- agent capability governance
- execution capability validation

This space exists because execution depends on capability.

CRGS governs whether capability remains sufficient.

G. Difference Between Responsibility and Capability

Responsibility defines what an actor must do.

Capability defines whether an actor can do it.

Responsibility creates obligation.

Capability enables execution.

An actor may be responsible without being capable.

An actor may be capable without being responsible.

Both conditions must exist.

RGS governs responsibility.

CRGS governs capability readiness.

H. Runtime Position

CRGS operates as the seventh foundational layer of AGA™.

It follows:

- Relationship Accountability Standard (RAS)
- Authority Governance Standard (AGS)
- Authority Delegation Standard (ADS)
- Authority Validation Standard (AVS)
- Authority Escalation Standard (AES)
- Responsibility Governance Standard (RGS)

and supports:

- Chain of Control Standard (CCS)
- Governance Oversight Standard (GOS)
- Evidence Accountability Standard (EAS)
- Accountability Governance Standard (AGS-A)
- Consequence Governance Standard (CGS)

CRGS governs whether execution capability exists before operational actions are performed.

I. Capability Readiness Failure Rule

Capability readiness failure occurs when assigned actors cannot reliably perform assigned responsibilities.

Examples include:

- insufficient qualifications
- invalid certifications
- missing competencies
- missing tools
- unavailable resources
- inaccessible systems
- incomplete information
- undertrained personnel
- incapable AI agents
- unavailable execution environments

CRGS exists to expose and govern these conditions.

J. Validity Logic

A capability-readiness environment is valid under CRGS when:

- qualifications remain verifiable
- competencies remain sufficient
- tools remain available

- resources remain accessible
- permissions remain valid
- operational conditions remain adequate
- execution capability remains demonstrable

A capability-readiness environment becomes invalid when:

- qualifications become insufficient
- competencies become inadequate
- tools become unavailable
- resources become inaccessible
- execution capability cannot be demonstrated
- operational readiness cannot be verified

K. Relationship to Other OOF Standards

CRGS derives from:

- Responsibility Governance Standard (RGS)
- Authority Governance Standard (AGS)
- Authority Validation Standard (AVS)

and supports:

- Chain of Control Standard (CCS)
- Governance Oversight Standard (GOS)
- Evidence Accountability Standard (EAS)
- Accountability Governance Standard (AGS-A)
- Consequence Governance Standard (CGS)

Responsibility determines who must act.

Capability determines whether they can act.

CRGS governs that capability.

L. Foundational Principle

Governance cannot require execution from actors that are not capable of execution.

Canonical Closing Statement

Capability Readiness Governance Standard (CRGS) defines the structural conditions under which actors, systems, organizations, agents, contractors, tools, resources, qualifications, competencies,

permissions, and operational environments remain capable of performing assigned responsibilities in a valid, traceable, governable, accountable, and operationally reliable manner.

Responsibility without capability creates failure. Capability without responsibility creates ambiguity. Trustworthy governance therefore requires both responsibility and demonstrable capability readiness.
