

DAM-A — Delegation Accountability Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-GOA-GDS-DAMA-2026-06-22-0004

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Governance Architecture (GOA™)

Operational Layer: Governance Delegation Governance Layer

Governed Space: Delegation Accountability

Category: Governance & Enforcement

Subcategory: Governance Delegation Governance

Type: Governance Delegation Standard Module

Parent Standard: Governance Delegation Standard (GDS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 22 June 2026

Compatibility: OOF Methodology OS · Governance Delegation Standard (GDS)

· Governance Accountability Standard · Governance Authority Standard (GAS)

· INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Delegation Accountability Module (DAM-A) defines the structural conditions under which accountability relationships associated with delegated authority remain identifiable, attributable, traceable, reviewable, governable, enforceable, auditable, and operationally valid throughout the governance lifecycle.

DAM-A governs delegation accountability.

The module establishes the foundational conditions required to determine who remains accountable after authority has been delegated, how accountability is preserved, whether accountability follows delegated authority, and whether accountability relationships remain reconstructable throughout operational reality.

Authority may be delegated.

Accountability must not disappear.

DAM-A governs that accountability.

Module Operational Role

DAM-A defines the delegation-accountability governance layer of GDS.

Its role is to preserve accountability visibility throughout delegated-governance environments.

Module Operational Space

DAM-A governs:

- delegation accountability
- delegated-authority accountability
- accountability preservation
- accountability attribution
- delegation-accountability relationships
- accountability auditability
- accountability traceability
- accountability reconstruction

The module applies wherever governance authority is delegated and accountability must remain identifiable.

Module Function

The module applies wherever systems must preserve:

- accountable delegated authority
- traceable accountability ownership
- reconstructable accountability history
- attributable governance decisions
- governance-valid accountability records
- operational accountability visibility

Its function is to ensure that governance can reconstruct who remained accountable throughout delegated-authority activities.

Minimum Implementation Framework

1. Define the Delegation Accountability Object

The organization must define which governance environments require delegation-accountability governance.

This may include:

- organizations
- institutions
- governments
- governance committees
- corporate governance structures
- AI governance systems
- autonomous-agent ecosystems
- Human-AI governance environments

2. Define Delegation Accountability Conditions

The system must define the conditions under which delegation accountability remains valid.

This includes:

- accountability requirements
- attribution requirements
- preservation requirements
- traceability requirements
- validation requirements
- governance-valid accountability conditions

3. Define Accountability Degradation Detection Logic

The system must define how delegation-accountability failures are identified.

This may include:

- accountability gaps
- hidden accountability ownership
- undocumented accountability transfers
- accountability ambiguity
- missing accountability records
- governance-invalid accountability activities

4. Define Operational Response or Governance Logic

The system must define governance logic for delegation-accountability failures.

Governance response may include:

- accountability review
- accountability verification
- governance intervention
- corrective actions
- accountability reconstruction
- attribution validation
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- accountability relationships
- delegated-authority ownership
- governance reviews
- intervention procedures
- validation activities
- resulting accountability states

A governance environment must not remain accountability-valid if materially significant accountability relationships cannot be reconstructed, reviewed, attributed, validated, preserved, or governed.

Use Case 1 — Executive Delegation Environment

Scenario

A senior executive delegates operational authority to department leadership while retaining ultimate governance responsibility.

Application

DAM-A governs accountability preservation, accountability attribution, and delegated-authority accountability relationships.

Result

The organization gains stronger accountability visibility, reduced accountability ambiguity, and improved governance oversight.

Use Case 2 — Human-AI Governance Environment

Scenario

Human governance actors delegate operational authority to AI systems while maintaining governance accountability for resulting actions and outcomes.

Application

DAM-A governs accountability ownership, accountability traceability, and governance-valid accountability preservation.

Result

The organization gains stronger Human-AI accountability visibility, reduced governance ambiguity, and improved governance responsibility management.

Canonical Closing Statement

Delegation Accountability Module (DAM-A) defines the structural conditions under which accountability relationships associated with delegated authority remain identifiable, attributable, traceable, reviewable, governable, enforceable, auditable, and operationally valid throughout the governance lifecycle.

Delegated authority that loses accountability cannot remain governance-valid. Delegation Accountability therefore becomes a foundational condition of trustworthy governance delegation governance.
