

DAM — Delegation Assignment Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-GOA-GDS-DAM-2026-06-22-0001

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Governance Architecture (GOA™)

Operational Layer: Governance Delegation Governance Layer

Governed Space: Delegation Assignment

Category: Governance & Enforcement

Subcategory: Governance Delegation Governance

Type: Governance Delegation Standard Module

Parent Standard: Governance Delegation Standard (GDS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 22 June 2026

Compatibility: OOF Methodology OS · Governance Delegation Standard (GDS)

· Governance Authority Standard (GAS) · Governance Accountability Standard

· INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Delegation Assignment Module (DAM) defines the structural conditions under which governance-authority delegations remain legitimate, attributable, traceable, reviewable, governable, enforceable, auditable, and operationally valid throughout the governance lifecycle.

DAM governs delegation assignment.

The module establishes the foundational conditions required to determine who receives delegated authority, how delegated authority is assigned, whether delegation remains legitimate, and whether delegation assignments remain reconstructable throughout operational reality.

Governance authority may be delegated.

Governance authority must also be assigned.

DAM governs that assignment.

Module Operational Role

DAM defines the delegation-assignment governance layer of GDS.

Its role is to establish governance-valid delegated-authority ownership throughout governance environments.

Module Operational Space

DAM governs:

- delegation assignment
- delegated-authority ownership
- delegation attribution
- delegation legitimacy
- delegation traceability
- delegation auditability
- delegation validation
- delegation reconstruction

The module applies wherever governance authority is assigned through delegation.

Module Function

The module applies wherever systems must preserve:

- legitimate delegation assignments
- attributable delegated authority
- traceable delegation pathways
- reconstructable delegation history
- governance-valid delegation records
- operational delegation visibility

Its function is to ensure that governance can reconstruct how delegated authority entered a governance environment.

Minimum Implementation Framework

1. Define the Delegation Assignment Object

The organization must define which governance environments require delegation-assignment governance.

This may include:

- organizations
 - institutions
-

- governments
- governance committees
- corporate governance structures
- AI governance systems
- autonomous-agent ecosystems
- Human-AI governance environments

2. Define Delegation Assignment Conditions

The system must define the conditions under which delegation assignments remain valid.

This includes:

- assignment requirements
- legitimacy requirements
- authorization requirements
- validation requirements
- traceability requirements
- governance-valid delegation conditions

3. Define Assignment Degradation Detection Logic

The system must define how delegation-assignment failures are identified.

This may include:

- unauthorized delegations
- undocumented delegation assignments
- illegitimate authority transfers
- hidden delegation ownership
- unverifiable delegation records
- governance-invalid delegation activities

4. Define Operational Response or Governance Logic

The system must define governance logic for delegation-assignment failures.

Governance response may include:

- delegation review
- delegation validation
- governance intervention
- corrective actions
- delegation reconstruction
- authority verification
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- delegation assignments
- delegated-authority records
- governance reviews
- intervention procedures
- validation activities
- resulting delegation states

A governance environment must not remain assignment-valid if materially significant delegation assignments cannot be reconstructed, reviewed, validated, enforced, preserved, or governed.

Use Case 1 — Enterprise Governance Environment

Scenario

A governance board delegates authority to department leaders responsible for operational governance decisions.

Application

DAM governs delegation assignments, delegated-authority ownership, and delegation legitimacy.

Result

The organization gains clearer authority ownership, reduced governance ambiguity, and stronger governance accountability.

Use Case 2 — Human-AI Governance Environment

Scenario

Human governance actors assign delegated governance authority to AI systems operating within approved governance boundaries.

Application

DAM governs delegation assignments, delegated-authority attribution, and governance-valid delegation procedures.

Result

The organization gains stronger delegation visibility, reduced governance ambiguity, and improved Human-AI governance coordination.

Canonical Closing Statement

Delegation Assignment Module (DAM) defines the structural conditions under which governance-authority delegations remain legitimate, attributable, traceable, reviewable, governable, enforceable, auditable, and operationally valid throughout the governance lifecycle.

Delegated authority cannot operate until delegated authority has been assigned. Delegation Assignment therefore becomes a foundational condition of trustworthy governance delegation governance.
