

DRM — Delegation Revocation Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-GOA-GDS-DRM-2026-06-22-0005

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Governance Architecture (GOA™)

Operational Layer: Governance Delegation Governance Layer

Governed Space: Delegation Revocation

Category: Governance & Enforcement

Subcategory: Governance Delegation Governance

Type: Governance Delegation Standard Module

Parent Standard: Governance Delegation Standard (GDS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 22 June 2026

Compatibility: OOF Methodology OS · Governance Delegation Standard (GDS)

· Governance Authority Standard (GAS) · Governance Accountability Standard

· Governance Validation Standard · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Delegation Revocation Module (DRM) defines the structural conditions under which delegated governance authority may be suspended, withdrawn, terminated, restricted, revoked, reviewed, governed, traceable, auditable, and operationally valid throughout the governance lifecycle.

DRM governs delegation revocation.

The module establishes the foundational conditions required to determine when delegated authority may be removed, how delegated authority is revoked, who may revoke delegated authority, and whether delegation revocation remains reconstructable throughout operational reality.

Delegated authority may be assigned.

Delegated authority may be validated.

Delegated authority may be revoked.

DRM governs that revocation.

Module Operational Role

DRM defines the delegation-revocation governance layer of GDS.

Its role is to establish governance-valid delegated-authority termination throughout governance environments.

Module Operational Space

DRM governs:

- delegation revocation
- delegated-authority withdrawal
- delegated-authority suspension
- delegated-authority termination
- delegation restriction
- delegation auditability
- delegation traceability
- delegation reconstruction

The module applies wherever delegated authority must be removed, suspended, restricted, or terminated.

Module Function

The module applies wherever systems must preserve:

- legitimate delegation revocations
- traceable authority withdrawals
- reconstructable revocation history
- attributable revocation decisions
- governance-valid revocation records
- operational governance control

Its function is to ensure that governance can reconstruct when, why, and how delegated authority was revoked.

Minimum Implementation Framework

1. Define the Delegation Revocation Object

The organization must define which governance environments require delegation-revocation governance.

This may include:

- organizations
- institutions
- governments
- governance committees
- corporate governance structures
- AI governance systems
- autonomous-agent ecosystems
- Human-AI governance environments

2. Define Delegation Revocation Conditions

The system must define the conditions under which delegation revocation remains valid.

This includes:

- revocation requirements
- authorization requirements
- legitimacy requirements
- traceability requirements
- validation requirements
- governance-valid revocation conditions

3. Define Revocation Degradation Detection Logic

The system must define how delegation-revocation failures are identified.

This may include:

- unauthorized revocations
- hidden authority removals
- undocumented revocation activities
- illegitimate authority withdrawals
- unverifiable revocation records
- governance-invalid revocation actions

4. Define Operational Response or Governance Logic

The system must define governance logic for delegation-revocation failures.

Governance response may include:

- revocation review
- revocation validation
- governance intervention
- corrective actions
- revocation reconstruction
- authorization verification
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- delegation revocations
- revocation decisions
- governance reviews
- intervention procedures
- validation activities
- resulting delegation states

A governance environment must not remain revocation-valid if materially significant delegation revocations cannot be reconstructed, reviewed, validated, attributed, preserved, or governed.

Use Case 1 — Organizational Governance Misconduct

Scenario

A governance actor violates governance obligations and delegated authority must be removed to protect governance integrity.

Application

DRM governs delegated-authority revocation, revocation legitimacy, and governance-valid authority-withdrawal procedures.

Result

The organization gains stronger governance protection, reduced governance risk, and improved governance control.

Use Case 2 — Human-AI Governance Environment

Scenario

An AI system exceeds approved governance conditions and delegated authority must be suspended until governance review is completed.

Application

DRM governs authority suspension, delegation revocation, and governance-valid intervention procedures.

Result

The organization gains stronger Human-AI governance control, reduced operational risk, and improved governance safeguard capability.

Canonical Closing Statement

Delegation Revocation Module (DRM) defines the structural conditions under which delegated governance authority may be suspended, withdrawn, terminated, restricted, revoked, reviewed, governed, traceable, auditable, and operationally valid throughout the governance lifecycle.

Delegated authority that cannot be revoked cannot remain governable. Delegation Revocation therefore becomes a foundational condition of trustworthy governance delegation governance.
