

DVM — Delegation Validation Module

OOF™ Origin Open Foundation™

Independent Methodological Authority

OriginID: OOF-OID-GOA-GDS-DVM-2026-06-22-0002

Architecture Ecosystem: Structured Reality Standards™

Architecture Family: Governance Architecture (GOA™)

Operational Layer: Governance Delegation Governance Layer

Governed Space: Delegation Validation

Category: Governance & Enforcement

Subcategory: Governance Delegation Governance

Type: Governance Delegation Standard Module

Parent Standard: Governance Delegation Standard (GDS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 22 June 2026

Compatibility: OOF Methodology OS · Governance Delegation Standard (GDS)

· Governance Authority Standard (GAS) · Governance Accountability Standard

· INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition System

Canonical Definition

Delegation Validation Module (DVM) defines the structural conditions under which governance-authority delegations remain legitimate, verifiable, attributable, traceable, reviewable, governable, enforceable, auditable, and operationally valid throughout the governance lifecycle.

DVM governs delegation validation.

The module establishes the foundational conditions required to determine whether delegated authority remains legitimate, whether delegation originates from a valid governance source, whether delegation remains governance-valid, and whether delegation validation remains reconstructable throughout operational reality.

Delegated authority may be assigned.

Delegated authority must also be validated.

DVM governs that validation.

Module Operational Role

DVM defines the delegation-validation governance layer of GDS.

Its role is to establish governance-valid delegation legitimacy throughout governance environments.

Module Operational Space

DVM governs:

- delegation validation
- delegation legitimacy verification
- delegated-authority validation
- delegation-source verification
- delegation auditability
- delegation traceability
- delegation reviewability
- delegation reconstruction

The module applies wherever delegated authority must be verified before governance actions may occur.

Module Function

The module applies wherever systems must preserve:

- validated delegations
- legitimate delegated authority
- verifiable delegation sources
- traceable delegation legitimacy
- governance-valid delegation records
- operational delegation confidence

Its function is to ensure that governance can verify whether delegated authority remains legitimate throughout operational reality.

Minimum Implementation Framework

1. Define the Delegation Validation Object

The organization must define which governance environments require delegation-validation governance. This may include:

- organizations
- institutions
- governments
- governance committees
- corporate governance structures
- AI governance systems
- autonomous-agent ecosystems
- Human-AI governance environments

2. Define Delegation Validation Conditions

The system must define the conditions under which delegation validation remains valid.

This includes:

- legitimacy requirements
- validation requirements
- authorization requirements
- attribution requirements
- traceability requirements
- governance-valid validation conditions

3. Define Validation Degradation Detection Logic

The system must define how delegation-validation failures are identified.

This may include:

- unauthorized delegations
- illegitimate delegation sources
- hidden delegation ownership
- unverifiable delegation records
- governance-invalid delegation relationships
- delegation legitimacy failures

4. Define Operational Response or Governance Logic

The system must define governance logic for delegation-validation failures.

Governance response may include:

- delegation review
- delegation verification
- governance intervention
- corrective actions
- delegation reconstruction
- legitimacy validation
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- delegation validations
- legitimacy reviews
- governance reviews
- intervention procedures
- validation activities
- resulting delegation states

A governance environment must not remain validation-valid if materially significant delegation validations cannot be reconstructed, reviewed, verified, validated, preserved, or governed.

Use Case 1 — Corporate Governance Delegation Review

Scenario

An organization periodically reviews whether delegated governance authority remains legitimate and aligned with governance objectives.

Application

DVM validates delegated-authority ownership, delegation legitimacy, and governance-valid delegation pathways.

Result

The organization gains stronger governance confidence, reduced delegation ambiguity, and improved governance accountability.

Use Case 2 — Human-AI Governance Environment

Scenario

An organization validates whether delegated governance authority assigned to AI systems remains legitimate and within approved governance conditions.

Application

DVM validates delegated-authority legitimacy, delegation-source validity, and governance-compliant delegation activities.

Result

The organization gains stronger governance trust,
reduced governance risk, and improved
Human-AI delegation oversight.

Canonical Closing Statement

Delegation Validation Module (DVM) defines the structural conditions under which governance-authority delegations remain legitimate, verifiable, attributable, traceable, reviewable, governable, enforceable, auditable, and operationally valid throughout the governance lifecycle.

Delegated authority that cannot be validated cannot remain governance-valid. Delegation Validation therefore becomes a foundational condition of trustworthy governance delegation governance.
