

DSIM — Decision Scope Integrity Module

OriginID: OOF-OID-AGA-DSIM-2026-06-17-0072Architecture **Ecosystem:**

Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Decision Accountability Governance Layer

Governed Space: Decision Scope Integrity

Category: Governance & Enforcement

Subcategory: Decision Accountability Governance

Type: Decision Accountability Standard Module

Parent Standard: Decision Accountability Standard (DAS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 17 June 2026

Compatibility: OOF Methodology OS · Decision Accountability Standard

(DAS) · Authority Governance Standard (AGS) ·

Accountability Governance Standard (AGS-A) · Evidence Accountability

Standard (EAS) · INTEGROS® — Integrity

Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Decision Scope Integrity Module (DSIM) defines the structural conditions under which decision boundaries, decision authority limits, decision objectives, decision obligations, decision constraints, decision expectations, decision impacts, and decision outcomes remain identifiable, traceable, governable, reconstructable, reviewable, and operationally valid throughout the decision lifecycle.

DSIM governs decision scope.

The module establishes the integrity conditions required to determine exactly what was decided, what was not decided, which authority boundaries applied, what impacts were expected, and where the decision scope begins and ends.

Module Operational Role

DSIM defines the decision-scope governance layer of DAS.

Its role is to preserve visibility into decision boundaries and decision coverage.

Module Operational Space

DSIM governs:

- decision scope
- decision boundaries
- decision authority limits
- decision objectives
- decision constraints
- decision expectations
- decision impacts
- decision coverage

The module applies wherever governance requires clarification of decision boundaries.

Module Function

The module applies wherever systems must preserve:

- clearly defined decisions
- visible decision boundaries
- reconstructable decision domains
- accountable decision structures
- governance-valid decision limits
- operational decision clarity

Its function is to ensure that governance can determine exactly what was decided and what remained outside the decision.

Minimum Implementation Framework

1. Define the Decision Scope Object

The organization must define which decision environments require scope governance.

This may include:

- organizational structures
- management systems
- boards
- governance frameworks
- contractor environments
- AI governance systems
- Human-AI decision environments
- operational decision systems

2. Define Decision Scope Conditions

The system must define the conditions under which decision scope remains valid.

This includes:

- decision-boundary requirements
- authority-limit requirements
- objective requirements
- constraint requirements
- governance requirements
- decision-scope conditions

3. Define Scope Degradation Detection Logic

The system must define how decision-scope failures are identified.

This may include:

- unclear decisions
- decision ambiguity
- overlapping decision authority
- scope expansion without approval
- governance-blind decision activity
- undefined decision boundaries

4. Define Operational Response or Governance Logic

The system must define governance logic for decision-scope failures.

Governance response may include:

- decision review
- scope verification
- governance intervention
- decision clarification
- corrective actions
- decision reassessment
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- decision boundaries
- decision objectives
- governance reviews
- validation activities
- intervention procedures
- resulting decision states

A decision-accountability environment must not remain scope-valid if materially significant decision boundaries cannot be reconstructed, reviewed, validated, clarified, or governed.

Use Case 1 — Executive Decision Environment

Scenario

A management board approves a strategic initiative that later creates operational consequences.

Application

DSIM determines exactly what was approved, what remained outside the approval scope, and where decision authority boundaries existed.

Result

Governance gains visibility into decision coverage and decision limitations.

Use Case 2 — Human-AI Decision Environment

Scenario

An AI-assisted decision platform provides recommendations that are reviewed and approved by human supervisors.

Application

DSIM determines exactly which parts of the recommendation became part of the final decision and which did not.

Result

Governance gains visibility into decision boundaries across intelligent operational ecosystems.

Canonical Closing Statement

Decision Scope Integrity Module (DSIM) defines the structural conditions under which decision boundaries, decision authority limits, decision objectives, decision obligations, decision constraints, decision expectations, decision impacts, and decision outcomes remain identifiable, traceable, governable, reconstructable, reviewable, and operationally valid throughout the decision lifecycle.

Decision accountability cannot be preserved if decision boundaries are unclear. Decision Scope Integrity therefore becomes a foundational condition of trustworthy decision
