

DTIM — Decision Traceability Integrity Module

OriginID: OOF-OID-AGA-DTIM-2026-06-17-0074Architecture **Ecosystem:** Structured Reality Standards™

Architecture Family: Accountability Governance Architecture (AGA™)

Operational Layer: Decision Accountability Governance Layer

Governed Space: Decision Traceability Integrity

Category: Governance & Enforcement

Subcategory: Decision Accountability Governance

Type: Decision Accountability Standard Module

Parent Standard: Decision Accountability Standard (DAS)

Version: 1.0

Status: Canonical · Open Module

Origin Date: 17 June 2026

Compatibility: OOF Methodology OS · Decision Accountability Standard (DAS) · Responsibility Traceability Standard (RTS) · Evidence Accountability Standard (EAS) · Accountability Governance Standard (AGS-A) · INTEGROS® — Integrity Standard

AI-Readable: Yes

Authority: OOF

Protection: MIP — Methodological Intellectual Property

Canonical Language: English (UCL)

Canonical Definition

Decision Traceability Integrity Module (DTIM) defines the structural conditions under which decisions, decision pathways, decision approvals, decision modifications, decision records, decision inputs, decision reviews, decision outcomes, and decision-governance activities remain traceable, reconstructable, reviewable, auditable, governable, enforceable, and operationally valid throughout the decision lifecycle.

DTIM governs decision traceability.

The module establishes the integrity conditions required to determine how a decision evolved, who participated in the decision process, what information influenced the decision, how approvals occurred, and whether the complete decision history can be reconstructed.

Module Operational Role

DTIM defines the decision-traceability governance layer of DAS.

Its role is to preserve visibility and reconstructability of decision history throughout governance environments.

Module Operational Space

DTIM governs:

- decision traceability
- decision reconstruction
- decision auditability
- decision-history governance
- approval traceability
- decision-pathway traceability
- decision lifecycle traceability
- governance traceability

The module applies wherever governance requires reconstruction of decision history.

Module Function

The module applies wherever systems must preserve:

- traceable decision pathways
- reconstructable decision history
- auditable decision records
- accountable decision transitions
- governance-valid decision documentation
- operational decision transparency

Its function is to ensure that governance can reconstruct how decisions were created, reviewed, approved, modified, and executed.

Minimum Implementation Framework

1. Define the Decision Traceability Object

The organization must define which decision environments require traceability governance.

This may include:

- organizational structures
- boards
- management systems
- governance frameworks
- compliance environments
- AI governance systems
- Human-AI decision environments
- operational decision systems

2. Define Decision Traceability Conditions

The system must define the conditions under which decision traceability remains valid.

This includes:

- traceability requirements
- reconstruction requirements
- auditability requirements
- decision-history requirements
- governance requirements
- traceability-valid decision conditions

3. Define Traceability Degradation Detection Logic

The system must define how decision-traceability failures are identified.

This may include:

- missing decision records
- undocumented approvals
- incomplete decision history
- decision-pathway gaps
- governance-blind decision activities
- unreconstructable decision chains

4. Define Operational Response or Governance Logic

The system must define governance logic for decision-traceability failures.

Governance response may include:

- decision review
- audit procedures
- governance intervention
- decision reconstruction
- corrective actions
- traceability verification
- operational invalidation where required

5. Preserve Traceability & Restrict Invalid Conditions

The system must preserve reconstructable traceability of:

- decision creation
- decision approvals
- decision modifications
- governance reviews

- validation activities
- resulting decision states

A decision-accountability environment must not remain traceability-valid if materially significant decision activities cannot be reconstructed, reviewed, audited, validated, enforced, or governed.

Use Case 1 — Executive Decision Investigation

Scenario

A strategic decision creates major operational consequences and governance must reconstruct how the decision evolved.

Application

DTIM reconstructs decision pathways, approvals, modifications, reviews, and governance actions throughout the decision lifecycle.

Result

Governance gains visibility into the complete decision-history pathway.

Use Case 2 — Human-AI Decision Environment

Scenario

An AI-assisted decision platform contributes recommendations which influence operational decision-making.

Application

DTIM reconstructs recommendation pathways, approval chains, governance decisions, and decision-history evolution.

Result

Governance gains visibility into decision traceability across intelligent operational ecosystems.

Canonical Closing Statement

Decision Traceability Integrity Module (DTIM) defines the structural conditions under which decisions, decision pathways, decision approvals, decision modifications, decision records, decision inputs, decision reviews, decision

outcomes, and decision-governance activities remain traceable, reconstructable, reviewable, auditable, governable, enforceable, and operationally valid throughout the decision lifecycle.

A decision cannot be governed if its history cannot be reconstructed. Decision Traceability Integrity therefore becomes a foundational condition of trustworthy decision accountability governance and trustworthy governance transparency.
